† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion New Milford and Woodcliff are Weehawken.

Daily Precipitation for August, 1922.

## U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

CHARLES F. MARVIN, Chief.

## CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXVII.

SEPTEMBER, 1922.

No. 9.

## GENERAL SUMMARY.

September weather will often show wide variations during a single month, and notable departure from normal conditions. September of 1922 was more than ordinarily remarkable for an almost total lack of rain after the 12th, no rain falling thereafter except some scattered amounts in south-central districts on the 24th. Prior to the 12th, rainfall conditions were practically normal, except that the greater portion of the entire month's amount occurred on that day. There were general rains on the 4th, and in northern districts on the 6th-7th. The frequency of days with measurable amounts of rain was 4 less than normal, and this deficiency has been exceeded only in 1908 and 1914. July and portions of June and August were rainier than usual and afforded a considerable impetus to the feeling that this summer was inordinately rainy, but from the middle of August to the close of September practically all excesses of moisture had been depleted to a deficiency, and all sections of the State, except the Red Sandstone Plain, for the year to date, show an accumulated slight deficiency of precipitation.

Periods of temperature fluctuation were not greatly varied either as to extremes or duration, and a slight excess of warmth accumulated during the month. The occurrence of frost and freezing temperatures in northern districts on the 26th was a normal occurrence. September without frosts in susceptible places would be notably abnormal.

The persistence of pleasant weather, sunshine and warmth greatly aided outdoor work, but was detrimental to plowing and seeding of fall grains and grasses and this work became somewhat behindhand. Late crops matured nicely and harvesting was carried forward advantageously.

Storm warnings were displayed along the coast on the 21st.

## TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 40 stations, was 66.7°, which was 1.1° above the normal. The highest temperature was 95° at Bridgeton and Burlington on the 6th, and the lowest, 27°, at Charlotteburg on the 26th. The highest monthly mean temperature was 69.9° at Bridgeton, and the lowest, 61.6° at Charlotteburg. The greatest daily range of temperature was 46° at Phillipsburg on the 27th.

The temperature departure from the normal for the year 1922 to date, by sections, is: The Highlands, +1.3°; Red Sandstone Plain, +0.9°; Southern Interior, +1.4°; Sea Coast, +1.4°.

## PRECIPITATION.

The mean total rainfall of the State, as deduced from observations of 47 stations, was 2.26 inches, which was 1.45 inches below the normal. The greatest monthly rainfall was 5.22 inches at Bergen Point, and the least, 0.59 inch at Long Branch. The greatest amount of rain in any 24 consecutive hours was 3.35 inches at Belvidere on the 4th. The mean of the number of days on which .01 inch or more of rain fell was 4, or 4 less than the normal.

The precipitation departure from the normal for the year 1922 to date, by sections, is: The Highlands, -0.40 inch; Red Sandstone Plain, +1.66 inches; Southern Interior, -2.31 inches; Sea Coast, -1.79 inches.

## WIND.

The prevailing wind direction was from the northeast, with an average velocity of 10 miles per hour, which was normal. The highest velocity, sustained for five consecutive minutes, was 48 miles per hour from the northeast on the 21st at Atlantic City. There were high winds also on the 24th and 25th.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 19, which was 5 more than the normal; partly cloudy, 5, or 4 less than the normal; cloudy, 6, or 1 less than the normal. The per cent of possible sunshine was 70, which was 2 per cent above the normal.

## MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.13 inches, which was 0.06 inch above the normal. The highest reading was 30.48 inches at Ridgefield on the 19th, and the lowest, 29.71 inches at Sandy Hook on the 24th.

The mean stage of the Delaware River at Phillipsburg was 1.2 feet, and the highest, 2.0 feet on the 5th. At Trenton the mean stage was 0.7 foot, which was 0.4 foot below the normal. The highest stage, 1.5 feet, occurred on the 5th.

Thunderstorms occurred in some portions of the State on the 1st, 4th, 6th, 11th, 12th, 24th, and 25th. Dense fog occurred on the 1st, 2d, 3d, 4th, 5th, 11th, 15th, 21st, and 24th. Solar halos were observed on the 6th, 17th, 20th, 21st, 22d, and 24th, and a lunar halo on the 1st. Frost occurred quite generally throughout the State on the 26th; killing in portions of Bergen, Morris, Passaic, and Sussex Counties, heavy elsewhere in the northern half of the State, and light in south Jersey. Light frost occurred on the 18th, 19th, and 20th in northern sections.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion New Milford and Woodcliff are Weehawken.

## Daily Precipitation for September, 1922.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXVII.

OCTOBER, 1922.

No. 10.

### GENERAL SUMMARY.

The weather of October was somewhat milder than normal, and considerably drier, with a moderate excess of sunshine and clear sky. A warm period the first week equalled the records of some districts for October, but there were no notably cold periods. The first day of killing frost occurred near the normal date, over the greater portion of the State. The lowest temperatures occurred over the northern counties, and the highest in the southwestern part of the State, which was also the region of least rainfall. The amount of rain was appreciably deficient and was a little below usual frequency. There were meagre showers from the 7th to the 11th, although with some interruptions. On the 15th there were rains in southern districts, and there were scattering amounts on the 17th but they did not amount to much. On the 23d-25th there were showers of good volume on the coast and in northeastern districts.

This deficiency in rain, following similar conditions in September, has developed into a drought of considerable severity. The Delaware River has been as low as has been recorded in nearly 18 years, and wells and springs have become dry, so that farmers have had to haul water for stock. This drought also impeded germination of fall sown grass and grain.

The fine open weather afforded the best opportunity for outdoor occupations, and farm work was brought forward, as well as all other operations in the open, under exceptionally favorable circumstances.

Storm warnings were displayed along the coast on the 7th.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 38 stations, was 56.6°, which was 1.6° above the normal. The highest temperature was 92° at Elizabeth on the 2d, Phillipsburg on the 4th, and Somerville on the 2d and 6th, and the lowest, 18° at Charlotteburg and Layton on 21st. The highest monthly mean temperature was 60.1° at Cape May City, and the lowest, 52.4° at Charlotteburg. The greatest daily range of temperature was 55° at Phillipsburg on the 2d.

The temperature departure from the normal for the year 1922, to date, by sections, is: The Highlands, +1.3°; Red Sandstone Plain, +0.9°; Southern Interior, +1.4°; Sea Coast, +1.4°.

### PRECIPITATION.

The mean total rainfall of the State, as deduced from observations of 47 stations, was 1.48 inches, which was 2.25 inches below the normal. The greatest monthly rainfall was 2.70 inches at Charlotteburg, and the least, 0.55 inch at Somerville. The greatest amount of rain in any 24 consecutive hours was 1.13 inches at South Orange on the 7th-8th. The mean of the number of days on which 0.01 inch or more of rain fell was 7, or 1 less than the normal. Traces of snow fell at Culvers Lake on the 24th and 26th, Newton on the 23d, and South Orange on the 24th.

The precipitation accumulated departure from the normal for the year 1922 to date, by sections, is: The Highlands, -2.43 inches; Red Sandstone Plain, -0.77 inch; Southern Interior, -4.44 inches; Sea Coast, -4.21 inches.

The prevailing wind direction was from the northwest, with an average velocity of 13 miles per hour, which was one mile above the normal. The highest velocity, sustained for 5 consecutive minutes, was 50 miles per hour from the south at Sandy Hook on the 23d. High winds occurred also on the 11th, 17th, 24th, and 26th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 19, or 5 more than the normal; partly cloudy, 6, or 2 less than the normal; cloudy, 6, or 3 less than the normal. The per cent of possible sunshine was 70, which was 7 per cent above the normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.02 inches, which was 0.05 inch below the normal. The highest reading was 30.48 inches at Cape May City on the 13th, and the lowest, 29.51 inches at Sandy Hook on the 25th.

The mean stage of the Delaware River at Phillipsburg was 1.2 feet, and the highest stage, 2.0 feet on the 5th. At Trenton the mean stage was 0.3 foot, which was 1.1 feet below the normal. The highest stage, 1.2 feet, occurred on the 14th.

Thunderstorms occurred in some portions of the State on the 8th, 23d, and 24th. Dense fog was noted on the 1st, 2d, 4th, 5th, 6th, 7th, 9th, 10th, 16th, 17th, 22d, 23d, and 24th. Lunar halos were observed on the 2d, 5th, 6th, and 14th, and solar halos on the 2d, 6th, 9th, 14th, 15th, 17th, and 28th. The aurora was observed on the 30th. Killing frost occurred in all portions of the State, excepting along the coast, on the 19th, and 20th, and at a few stations in northern districts on the 14th.

### ERRATA.

August 1922:—Page 30: Moorestown, total precipitation should read 4.68 inches instead of 3.88 inches; departure from normal, -0.21 inch instead of -0.88; rainy days 10, instead of 9. Page 31: Moorestown, rainfall on 31st should read 0.40 instead of 0, and monthly total 4.68.

† On other dates also.

‡ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion New Milford and Woodcliff are Weehawken; Northfield is Pleasantville.

Daily Precipitation for October, 1922.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXVII.

NOVEMBER, 1922.

No. 11.

### GENERAL SUMMARY.

The weather was notably pleasant during November, there having been a slightly subnormal volume of precipitation as well as a deficiency in low temperatures and cloudiness. There were but few occurrences of consecutive freezing days, while, on the other hand, there were many days with temperatures in the upper sixties. From the first of the month through the nineteenth, the warmth was mostly slightly above normal, and subnormal thereafter. In northern and eastern districts the period of warm weather terminated with a thundershower on the 20th, which was attended by hail in several localities, and which was a somewhat unusual occurrence for November. There was hardly enough snow for comment.

This open weather resulted in very favorable opportunities for bringing farm work well in hand. Plowing was carried on, and wood for fuel was prepared in unusually large quantities. The mild weather also resulted in a considerable saving in the consumption of fuel.

The lack of rain resulted in a further depletion of water supply resources, and while municipal supplies were not scanty, private sources failed. Wells, springs, ponds and streams were lower and for longer periods than has heretofore been recorded.

Taking the State as a whole, from the year 1917 to date, inclusive, there has been a steadily increasing deficiency of precipitation. The years 1919 and 1920 were slightly above normal in precipitation, but all the other years, or almost any one of them, more than made up for those two years of excess. The lack of water supply, then, must be attributed to more than the deficient rainfall these past few months.

Storm warnings were displayed along the coast on the 23d, 28th, and 30th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations, was 44.3°, which was 1.3° above the normal. The highest temperature was 73° at Bridgeton on the 12th, and the lowest, 13°, at Boonton on the 26th. The greatest daily range of temperature was 44° at Sussex on the 1st. The highest monthly mean temperature was 48.2° at Cape May City, and the lowest, 40.0° at Layton.

The temperature departure from the normal for the year 1922, to date, by sections, is: The Highlands, +1.3°; Red Sandstone Plain, +0.9°; Southern Interior, +1.4°; Sea Coast, -1.3°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 47 stations, was 0.91 inch, which was 2.29 inches below the normal. The average snowfall was 0.2 inch, which was 1.5 inches below the normal. The greatest monthly precipitation was 1.56 inches at Highwood, and the least, 0.49 inch at Phillipsburg. The greatest amount of precipitation in any 24 consecutive hours was 0.73 inch at Vineland on the 15th. The mean of the number of days on which 0.01 inch or more of precipitation fell was 6, or 2 less than the normal.

The precipitation accumulated departure from the normal for the year 1922 to date, by sections, is: The Highlands, -5.03 inches; Red Sandstone Plain, -3.01 inches; Southern Interior, -6.64 inches; Sea Coast, -6.46 inches.

JAN 8 1923

### WIND.

The prevailing direction was from the northwest. The wind movement averaged 13 miles per hour, which was normal. The highest velocity, sustained for 5 consecutive minutes, was 51 miles per hour from the northwest at Sandy Hook on the 24th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was 1 more than the normal; partly cloudy, 8 or 1 less than the normal; cloudy, 9, or normal. The per cent of possible sunshine was 54, which was 4 per cent below the normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.08 inches, which was 0.02 inch below the normal. The highest reading was 30.47 inches at Cape May City on the 10th and Atlantic City on the 13th, and the lowest, 29.43 inches at Sandy Hook on the 24th.

The mean stage of the Delaware River at Phillipsburg was 0.4 foot, and the highest stage, 0.5 foot on the 9th to 12th, and 20th to 22d, inclusive. At Trenton the mean daily stage was zero, which was 1.7 feet below the normal. The highest stage was 0.2 foot on the 7th, and the lowest, -0.1 foot on the 28th.

The first killing frosts of autumn did not occur along the coast until the 22d, and in some portions of the 25th. Dense fog occurred on the 2d, 3d, 5th, 6th, 7th, 8th, 11th, and 20th. Thunderstorms were noted in some portions of the State on the 3d and 20th. Solar halos were observed on the 2d, 6th, 11th, 14th, 18th, and 27th, and lunar halos on the 5th, 29th, and 30th. Hail fell at Bergen Point, Elizabeth, and Ridgefield on the 20th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion New Milford and Woodcliff are Weehawken; Northfield is Pleasantville.

Daily Precipitation for November, 1922.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXVII.

DECEMBER, 1922.

No. 12.

GENERAL SUMMARY.

With the termination of December the second consecutive year with a notable deficiency of accumulated precipitation has passed into climatological history. The year was also slightly above normal in warmth, as was also 1921. The month of December itself was practically normal, with the usual amount of snow, freezing nights and thawing days, but with a slight surplus of frequency of precipitation and deficiency of sunshine. From the 1st to the 5th, and from the 21st to the 27th temperatures were mostly above normal, and somewhat below normal the remaining periods of the month. Small bodies of still water became mostly frozen by the 15th, except in southern districts, and continued closed over with ice through the close of the month. The Delaware river remained open, except in some of the extreme upper reaches.

Moderate snow storms were frequent and occurred on the 7th, 14th, 17th, 23d, 28th and 29th and in the southern half of the State on the 10th. Rain occurred on the 3d, 5th, 8th, 12th, 15th and 21st.

The storm of the 28th-29th was attended by gales which were severe just off the coast, and was followed by the lowest temperature of the month; readings below zero having occurred in the interior and northern districts. There was slight damage from sleet in northeastern districts during the storm, caused principally by wind against ice-laden wires. Very good sleighing prevailed in northern counties after the storm.

Storm warnings were displayed along the coast on the 4th, 5th, 9th, 11th, 12th, 17th, 20th, 22d, 27th, 28th, and 31st.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations, was 32.5°, which is 0.4° below the normal. The highest temperature was 65° at Tuckerton on the 1st, and the lowest, 8° below zero at Sussex on the 30th. The greatest daily range of temperature was 41° at Sussex on the 30th and Belle Plain on the 31st. The highest monthly mean was 38.3° at Cape May City, and the lowest, 27.6° at Layton.

The temperature departure from the normal for the year 1922, by sections, is: The Highlands, +1.1°; Red Sandstone Plain, +0.8°; Southern Interior, +1.3°; Sea Coast, +1.2°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 42 stations, was 3.86 inches, which is 0.11 inch below the normal. The greatest monthly precipitation was 5.26 inches at Pleasantville, and the least, 3.09 inches at Newton. The average total snowfall was 7.3 inches, which was 0.1 inch above the normal; this average ranged from 8.9 inches in The Highlands to 5.0 inches in the Southern Interior. The greatest precipitation accumulated in any 24 consecutive hours was 2.52 inches at Atlantic City on the 28th. The average number of days on which 0.01 inch or more of precipitation fell was 12, or 3 more than the normal.

The precipitation accumulated departure from the normal for the year 1922, by sections, is: The Highlands, -5.71 inches; Red Sandstone Plain, -3.05 inches; Southern Interior, -6.61 inches; Sea Coast, -6.35 inches.

### WIND.

The prevailing wind direction was from the northwest, which was normal. The wind movement averaged 12 miles per hour, which was 2 miles below the normal. The highest velocity, sustained for 5 consecutive minutes, was 60 miles per hour from the northeast at Atlantic City on the 28th. High winds were noted also on the 12th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 9, which was 3 less than the normal; partly cloudy, 9, or normal; cloudy, 13, which was 3 more than the normal. The per cent of possible sunshine was 39, which was 13 per cent below the normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.15 inches, which was 0.05 inch above the normal. The highest reading was 30.70 inches at Ridgefield on the 11th, and the lowest, 29.28 inches at Atlantic City and Cape May City on the 28th.

The mean stage of the Delaware River at Phillipsburg was 0.4 foot, and the highest stage, 0.7 foot on the 28th and 31st. At Trenton the mean daily stage was 0.1 foot, which was 2.5 feet below the normal. The highest stage was 0.4 foot on the 24th, 25th, 29th, and 30th, and the lowest, -0.2 foot on the 1st and 2d.

Dense fog occurred on the 1st, 3d, 4th, 5th, 7th, 8th, 9th, 12th, 15th, 17th, 24th, 25th, 26th, 27th, and 28th. Sleet was observed generally throughout the State on the night of the 28th-29th, the fall averaging an inch; while small amounts fell at several stations on the 3d, 4th, 7th, 8th, 11th, 12th, 14th, 16th, 17th, and 21st.

Solar halos were observed on the 3d, 4th, 9th, 11th, 13th, and 24th, and lunar halos on the 2d, 11th, 24th, and 30th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, \*, b, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

## Daily Precipitation for December, 1922.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION,

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXVII.

ANNUAL SUMMARY, 1922.

No. 13.

### GENERAL SUMMARY.

A few salient features of the weather of 1922 should be mentioned, which are not usually remembered accurately, unless supported by unquestioned records. In New Jersey it was a slightly warmer year than normal; from February to June, inclusive, it was warmer than normal, and in October also; but slightly subnormal during the other periods. It was rainier than normal in June and July, and in many portions of the State in May. In the western part of the State, however, there was some drought in July which was not entirely overcome by August's rains, before the serious drought of the last 4 months of the year set in.

The warmth and moisture of June and July developed bacteriological plant enemies to a considerable extent.

The average of the State precipitation for the period from 1903 to date shows one or two significant features; the quantity has been notably deficient. During this period there have been 11 years of subnormal precipitation, 4 years above normal, and 4 years normal. This would seem to indicate that resulting stream flow and level of lake waters might be somewhat lower than normal, and perhaps gradually decreasing. It would also seem probable that the water table might be somewhat below normal. There have never been more than 3 abnormally dry or wet consecutive years, and as we have had two dry years, it would seem that there might be an increase of moisture this year.

The mean temperature for the year, 52.6°, was 1.1° above the normal. The warmest month was July, 73.0°, and the coldest, January, 27.6°. The highest temperature was 98° at Sussex on July 12th, and the lowest, 11° below zero at Charlotteburg on January 17th. The highest mean temperature was 55.9° at Bridgeton, and the lowest, 48.4° at Charlotteburg. The greatest annual range of temperature was 106° at Sussex.

The average precipitation for the State, for the year, was 41.57 inches, which was 5.25 inches below the normal. The greatest monthly average was 6.31 inches in June, and the least 0.91 inch in November. The greatest monthly precipitation was 11.50 inches at Newark in June, and the least, 0.49 inch at Phillipsburg in November. The greatest annual precipitation was 51.80 inches at Newark, and the least, 32.34 inches at Trenton.

The average snowfall for the State was 31.7 inches, which was 1.9 inches below the normal. The greatest annual snowfall was 61.0 inches at Culvers Lake, and the least, 15.7 inches at Sandy Hook.

The average number of days on which 0.01 inch or more of precipitation occurred was 119, which was 5 more than the normal. The average number of clear days was 169, which was 28 more than the normal; partly cloudy, 90, which was 26 less than the normal; cloudy, 106, which was 2 less than the normal.

The prevailing wind direction was from the northwest; the highest velocity was 78 miles per hour from the northeast at Long Branch on January 11th.

Unimportant occurrences of hail were on April 12th, 15th, 20th, and 23d, May 19th and 28th, June 6th, 11th, and 21st,

and August 1st, 3d, 5th, 7th, and 31st. Minor damage from hail occurred at several stations on July 28th. Considerable damage from hail occurred at Ridgefield on July 13th, and at Chatham on July 28th.

### COMPARATIVE ANNUAL DATA FOR THE STATE.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXVIII.

JANUARY, 1923.

No. 1.

### GENERAL SUMMARY.

There was considerable contrast between the weather conditions which prevailed in the northern and southern divisions of the State during January. The northern portion was sub-normal in warmth, sunshine and bright, clear days, and there was a moderate excess of snow. The southern counties, however, were slightly above normal temperature and, in fact, averaged above freezing, thus contributing effectively toward relief from the fuel shortage. The 17th, 18th, 30th, and 31st were the coldest days, and the warmest were the 1st and 21st, and the variability of temperature was not marked by great extremes. The frequency and amount of precipitation, both snow and rain, were not much above normal conditions. Snow remained on the ground in northern counties very constantly, and afforded good sleighing on roads which were not cleared. The mean temperature for the State averaged ten degrees warmer than the record breaking month of January, 1918, and eleven degrees colder than January, 1890. Violent and damaging storms were mostly lacking, and the snowfall offered no hindrance to transportation or wire facilities. Farming activities diminished to the usual midwinter minimum, except that there were occasional days when some plowing was done in southern counties. Much general hauling was done, and more than the usual amount of firewood was prepared and used.

Storm warnings were displayed along the coast on the 1st, 3d, 6th, 7th, 10th, 11th, 14th, 18th, 20th, 24th, and 25th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 30.1°, which was 0.2 above the normal. The highest temperature was 66° at Long Branch on the 21st, and the lowest, 14° below zero at Layton on the 31st. The greatest daily range was 44° at Boonton on the 18th and at Charlotteburg on the 20th. The highest monthly mean was 35.8° at Vineland and the lowest, 23.9° at Layton.

The temperature departure from the normal for the year 1923 to date, by sections, is: The Highlands, -0.6°; Red Sandstone Plain, -0.8°; Southern Interior, +1.4°; Sea Coast, +1.5°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 44 stations, was 5.22 inches, which was 1.57 inches above the normal. The greatest monthly precipitation was 7.26 inches at Ridgefield, and the least, 3.41 inches at Pleasantville. The average total snowfall was 16.6 inches, which was 7.7 inches above the normal; this average ranged from 27.7 inches in the Highlands to 6.2 inches in the Southern Interior. The greatest precipitation accumulated in any 24 consecutive hours was 2.83 inches at Vineland on the 1st. The average number of days on which .01 inch or more of precipitation fell was 12, which was 1 more than the normal.

The precipitation accumulated departure from the normal for the year 1923 to date, by sections, is: The Highlands, +1.48 inches; Red Sandstone Plain, +1.75 inches; Southern Interior, +1.58 inches; Sea Coast, +1.17 inches.

### WIND.

The prevailing wind direction was from the northwest, which was normal. The wind movement was 15 miles per hour, which was 1 mile above the normal. The highest velocity, sustained for 5 consecutive minutes, was 72 miles per hour from the south-east at Atlantic City on the 24th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 9, which was 1 less than the normal; partly cloudy 7, or 2 less than the normal; cloudy, 15, or 3 more than the normal. The per cent of possible sunshine was 42, which was 8 per cent below the normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.09 inches, which was 0.02 inch below the normal. The highest reading was 30.83 inches at Sandy Hook on the 23d, and the lowest, 29.41 inches at Ridgefield on the 1st.

The mean stage of the Delaware River at Phillipsburg was 2.7 feet, and the highest 5.0 feet on the 3d. At Trenton the mean daily stage was 1.8 feet, which was 1.8 feet below the normal. The highest stage was 3.6 feet on the 3d, and the lowest, 0.7 foot on the 1st.

Dense fog occurred on the 1st, 6th, 9th, and 21st. Sleet was observed quite generally throughout the northern half of the State on the 31st, and at scattered stations on the 3d, 8th, 22d, 24th, and 25th. Solar halos were observed on the 16th, 20th, 23d, 26th, and 27th, and lunar halos on the 2d, 5th, 23d, and 24th. Thunder was heard at Cape May City on the 20th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion; New Milford and Woodcliffe Lake are Weehawken; Northfield is Pleasantville.

Daily Precipitation for January, 1923.

## CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXVIII.

FEBRUARY, 1923.

No. 2.

## GENERAL SUMMARY.

It was not commonly appreciated that February of 1923 was the coldest February since that of 1914, and that there have been but eight colder, since 1885. There was no particularly intense cold during the month, but the record was the result of sustained moderate cold. From central districts northward there was hardly a day wherein the temperature was not at sometime below freezing. The highest temperature at any station, 56°, was much lower than usually occurs, the high extreme more often being in the sixties, and sometimes in the seventies. There were a few days at the commencement and the close of the month and on the 9th and 13th when temperatures were above normal, but at other times they were subnormal.

Precipitation occurred generally on the 1st, 3d, 6th, 7th, 10th, 13th, 14th, 20th, and the 3 closing days of the month. There were seven to ten days of snowfall, and snow remained very persistently on the ground over the northern half of the State throughout the month. Sleighing was continuous in nearly all northern regions. The ice harvest was somewhat light and uncertain in central and southern counties, although an adequate supply was secured in nearly all instances.

An area of low pressure, passing this region the night of the 13th-14th, was of somewhat convectional characteristics, and thunder and hail were reported in some districts. There may be some uncertainty as to whether it was hail or sleet, but general atmospheric conditions were somewhere indicative of the possibility of hail.

Storm winds were not usually prevalent, and storm warnings were displayed along the coast on the 2d, 5th, 6th, 12th, 14th, 15th and 17th.

## TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations, was 26.1°, which was 3.6° below the normal. The highest temperature was 56° at Indian Mills on the 9th, and the lowest, 12° below zero at Culvers Lake on the 8th. The greatest daily range of temperature was 48° at Sussex on the 8th. The highest monthly mean was 31.0° at Vineland, and the lowest, 21.0° at Boonton.

The temperature departure from the normal for the year 1923 to date, by sections, is: The Highlands, -3.8°; Red Sandstone Plain, -5.0; Southern Interior, -1.6°; Sea Coast, -2.1°.

## PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 45 stations, was 2.58 inches, which was 1.03 inches below the normal. The greatest monthly precipitation was 3.74 inches at Tuckerton, and the least, 1.51 inches at Sussex. The average total snowfall was 13.8 inches, which was 3.6 inches above the normal; this average depth ranged from 18.3 inches in the Highlands to 9.4 inches in the Southern Interior. The greatest precipitation accumulated in any 24 consecutive hours was 1.56 inches at Northfield on the 13th. The average number of days on which 0.01 inch or more of precipitation fell was 12, which was 3 more than the normal.

The precipitation accumulated departure from the normal for the year 1923 to date, by sections, is: The Highlands, +0.11 inch; Red Sandstone Plain, +0.28 inch; Southern Interior, +1.10 inches; Sea Coast, +0.44 inch.

## WIND.

The prevailing wind direction was from the northwest, with a velocity of 14 miles per hour, which was normal. The highest wind velocity, sustained for 5 consecutive minutes, was 64 miles per hour from the west at Sandy Hook on the 14th. High winds were noted also on the 6th, 15th, 23d, and 24th.

## SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 10, which was 1 less than the normal; partly cloudy days, 8, or normal; cloudy days, 10, which was 1 more than the normal. The per cent of possible sunshine was 46, which was 10 per cent below the normal.

## MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.14 inches, which was 0.04 inch above the normal. The highest reading was 30.62 inches at Sandy Hook and Trenton on the 6th, and the lowest, 29.58 inches at Trenton on the 3d.

The mean stage of the Delaware River at Phillipsburg was 2.3 feet, and the highest stage was 3.0 feet on the 1st and 4th. At Trenton the river was frozen.

Dense fog occurred on the 1st, 2d, 3d, 13th, 14th, 27th, and 28th. Sleet was observed at a few stations on the 10th, 12th, 13th, 14th, 26th, and 28th.

A solar halo was observed on the 2d, and a lunar halo on the 28th.

A thunderstorm was reported at Sussex on the night of the 13th-14th. Hail was reported at Newton and Sussex on the night of the 13th-14th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion; New Milford and Woodcliffe Lake are Weehawken; Northfield is Pleasantville.

## Daily Precipitation for February, 1923.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXVIII.

MARCH, 1923.

No. 3.

### GENERAL SUMMARY.

There was a general absence of many of the usual disagreeable features of typical March weather in New Jersey during March, 1923. The 2d, 3d, and 4th were pleasantly warm as well as the 11th, 16th, 22d, and 23d, the latter being the warmest day on record for the last decade of the month in many localities. This warm day, with temperatures in the upper 70's almost everywhere, was followed by a violent reaction, with an attendant thundershower and wind squalls that caused considerable damage to trees and structures. During one of these squalls an extreme velocity of 90 miles per hour occurred for a fraction of a minute in Trenton. Cold waves brought the month to a close, with attending temperatures of 10° or thereabouts on the 28th, 29th and 31st, which, in most instances, were records for so late in the month.

Snow disappeared from the ground from the 12th to 17th in extreme northern counties, and the total fall throughout, while slightly greater than normal, was not of particular importance.

The variation of warmth and moisture from the normal was unimportant. The amount of clear sky and sunshine was slightly greater than normal, and afforded some slight benefit to outdoor operations.

The cold waves at the close of the month greatly retarded vegetation, especially in southern districts, and the ground was mostly unfit for farm work.

Storm warnings were displayed along the coast on the 4th, 6th, 7th, 10th, 15th, 16th, 18th, 19th, and continuously the last four days of the month.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 40 stations was 38.0°, which was 0.7° below the normal. The highest temperature was 81° at Bridgeton on the 23d, and the lowest, -3° at Layton on the 9th. The highest monthly mean temperature was 43.4° at Vineland, and the lowest, 32.8° at Layton. The greatest daily range of temperature was 42° at Tuckerton on the 3d, Burlington on the 5th, and Lumberton on the 30th.

The temperature departure from the normal for the year 1923 to date, by sections, is: The Highlands, -1.8°; Red Sandstone Plain, -2.2°; Southern Interior, -0.3°; Sea Coast, -0.8°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 45 stations was 4.09 inches, which was 0.16 inch above the normal. The greatest monthly precipitation was 6.73 inches at Cape May City, and the least, 2.13 inches at Sussex. The average total snowfall was 6.3 inches, which was 0.4 inch above the normal; this average ranged from 7.7 inches in the Highlands to 4.8 inches in the Southern Interior. The greatest precipitation accumulated in any 24 consecutive hours was 2.85 inches at Vineland on the 16th and 17th. The average number of days on which .01 inch or more of precipitation fell was 10 which was 1 less than the normal.

The precipitation accumulated departure from the normal for the year 1923 to date, by sections, is: The Highlands, -0.76 inch; Red Sandstone Plain, +0.12 inch; Southern Interior, +1.95 inches; Sea Coast, +1.28 inches.

### WIND.

The prevailing wind direction was from the northwest, with a velocity of 15 miles per hour, which was 1 mile above the normal. The highest wind velocity, sustained for 5 consecutive minutes, was 73 miles per hour from the south on the 16th at Sandy Hook.

### SUNSHINE AND CLOUDINESS.

The mean of the number of clear days throughout the State was 17, which was 3 more than the normal; partly cloudy 6, which was 2 less than the normal; cloudy, 8, which was 1 less than the normal. The mean per cent of possible sunshine was 64, which was 3 per cent above the normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 6.8 feet, and the highest, 14.5 feet on the 25th. At Trenton the mean daily stage was 4.5 feet, which was 0.4 foot above the normal; the highest stage was 8.0 feet on the 25th.

The mean atmospheric pressure, reduced to sea level, was 30.05 inches, which was 0.04 inch above the normal. The highest reading was 30.78 inches at Sandy Hook on the 15th, and the lowest, 29.01 inches at Atlantic City on the 7th. Dense fog was reported on the 1st, 12th, 13th, 16th, 19th, 22d and 23d. Sleet occurred generally throughout the State on the 6th, and 7th, and at a few stations on the 10th, 12th, 16th, 19th, and 26th. Solar halos were observed on the 3d, 5th, 11th, 21st, 25th and 29th, and lunar halos on the 2d, 25th, and 29th. Thunderstorms occurred in some portions of the State on the 19th, 22d, and 23d.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion; New Milford and Woodcliffe Lake are Wechawken; Northfield is Pleasantville.

Daily Precipitation for March, 1923.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXVIII.

APRIL, 1923.

No. 4.

### GENERAL SUMMARY.

April opened with the lowest temperature readings ever recorded in that month in New Jersey, being some five degrees lower than previous records. The low readings ranged from 3° to 16° from the extreme north to the extreme south of the State on the morning of the 1st. On the 14th, in central portions of the State, there was a moderate fall of snow, of brief duration, and remaining on the ground but a short time. These winter conditions contributed to a backward spring, which with drying winds, and no surplus moisture, retarded the growth of vegetation and germination. Three warm days, the 20th, 21st and 22d, were attended by maximum temperatures mostly in the 80's, but cooler weather again followed. From the 5th to the 28th there was very little rainfall, except a moderate amount on the 13th and 14th in central sections, and drought conditions were becoming pronounced when rain set in on the 29th. Clear, open weather was considerably in excess of normal, and was especially favorable for outside work.

Storm warnings were displayed along the coast on the 7th, 13th and 14th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations was 50.0°, which was 0.5° above the normal. The highest temperature was 91° at Paterson on the 21st, and the lowest, 3° at Culvers Lake on the 1st. The highest mean monthly temperature was 52.4° at Bridgeton, Lumberton and Paterson, and the lowest 47.4° at Long Branch. The greatest daily range of temperature was 48° at Layton on the 26th.

The temperature departure from the normal for the year 1923 to date, by sections, is: The Highlands, -1.2°; Red Sandstone Plain, -1.5°; Southern Interior, -0.2°; Sea Coast, -0.6°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 46 stations, was 3.55 inches, which was 0.10 inch below the normal. The mean total snowfall was 0.5 inch, which was 0.3 inch below the normal. The greatest monthly precipitation was 6.59 inches at Camp Dix, and the least, 2.27 inches at Phillipsburg. The greatest amount of precipitation in any 24 consecutive hours was 3.21 inches at Chatham on the 29th. The mean number of days on which 0.01 inch or more of precipitation occurred was 9 or 1 less than normal.

The precipitation accumulated departure from the normal for the year 1923 to date, by sections, is: The Highlands, -1.55 inches; Red Sandstone Plain, -0.35 inch; Southern Interior, +2.56 inches; Sea Coast, +1.57 inches.

### WIND.

The prevailing wind direction was from the southwest, with a velocity of 16 miles per hour, which was 3 miles above the normal. The highest wind velocity, sustained for 5 consecutive minutes, was 65 miles per hour from the south at Sandy Hook on the 28th. High winds were reported also on the 5th, 14th, and 22d.

### SUNSHINE AND CLOUDINESS.

The mean of the number of clear days throughout the State was 16, which was 5 more than the normal; partly cloudy, 6, which was 4 less than the normal; cloudy, 8, which was 1 less than the normal. The per cent of possible sunshine was 65 which was 8 per cent above the normal.

MAY 28

### MISCELLANEOUS.

The mean daily stage of the Delaware River at Phillipsburg was 5.0 feet, and the highest stage 13.5 feet on the 7th. At Trenton the mean stage was 3.2 feet, which was 0.7 foot below the normal; the highest stage was 8.1 feet on the 7th.

The mean atmospheric pressure, reduced to sea level, was 29.99 inches, which was 0.01 inch below the normal. The highest reading was 30.70 inches at Cape May on the 1st, and the lowest, 29.33 inches, at Trenton on the 29th.

Dense fog was reported on the 4th, 5th, 13th, and 28th. Sleet was reported on the 13th, 14th and 15th. Solar halos were observed on the 2d, 3d, 4th, 7th, 9th, 12th, 13th, 17th, 19th, and 27th. Lunar halos were observed on the 2d, and 27th. Thunderstorms occurred on the 4th, 5th, and 28th.

A violent storm of severe proportions hit Hunterdon County on April 5th, 1923. It became extremely dark, and rain fell almost as a solid sheet of water accompanied by a terrific wind, and by lightning and thunder. The most violent part of the storm did not last more than ten minutes and within half an hour the rain had turned to a gentle April shower, but in its wake damage of many thousand dollars in the County. It was not of unusual violence in other portions of the State. At the same time a severe wind storm occurred in Bordentown.

Hail fell at Flemington on the 5th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Pleasantville is Atlantic City; Ridgefield is Morsermere; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

Daily Precipitation for April, 1923.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXVIII.

MAY, 1923.

No. 5.

### GENERAL SUMMARY.

The last "Spring" month has omitted many of the desirable and frequently occurring weather conditions which are normal to New Jersey. May droughts and mean temperatures under 60° are infrequent, yet both these conditions obtained in 1923. It added to a deficiency of both warmth and moisture, accumulated from the first of the year and even more remotely, so that it was frequently remarked that a "year without a summer" was about to occur. May of 1917 was 5° colder than May of 1923, but there was more nearly a normal amount of rain. Mays with less rain have occurred in 1911, 1903, and 1887, but they were practically all of normal warmth. The number of clear days, 20, was a notable exception to normal, and densely overcast skies occurred but seldom.

The rain occurred principally on the 8-9th, 12-13th, 16-17th, in northern districts, and on the 21st.

Durning the first three weeks there were a few scattered days slightly warmer than normal but most of this period it was cool and dry. On the 11th temperatures averaged 10° to 15° below normal, and freezing or killing frosts occurred over extended areas. From the 25th to 30th, summer conditions became frequent.

The weather was remarkably favorable for out-of-door occupations, and farm work was well in hand or in advance of normal, but crop conditions became discouraging on account of the cold ground and lack of moisture.

Storm warnings were displayed along the coast on the 8th, 11th, and 15th.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 38 stations, was 59.1°, which was 1.3° below the normal. The highest temperature was 90° at Paterson on the 26th, and Bridgeton, Burlington and Tuckerton on the 29th, and the lowest, 25°, at Layton on the 11th. The highest monthly mean temperature was 62.4° at Bridgeton, and the lowest, 54.3° at Asbury Park. The greatest daily range of temperature was 48° at Belle Plain on the 25th.

The temperature departure from the normal for the year 1923 to date, by sections, is: The Highlands, -1.3°; Red Sandstone Plain, -1.3°; Southern Interior, -0.4°; Sea Coast, -0.8°.

### PRECIPITATION.

The average total precipitation of the State, as deduced from observations of 45 stations, was 1.66 inches, which was 2.08 inches below the normal. The greatest monthly amount was 3.62 inches at Newark, and the least 0.67 inch at Pleasantville. The greatest amount accumulated in any 24 consecutive hours was 1.30 inches at Tuckerton on the 9th. The average number of days on which .01 inch or more of rain fell was 6, which was 5 less than the normal.

The accumulated precipitation departure from the normal for the year 1923 to date, by sections, is: The Highlands, -2.59 inches; Red Sandstone Plain, -2.53 inches; Southern Interior, -0.01 inch; Sea Coast, -0.54 inch.

### WIND.

The prevailing wind direction was from the southwest with an hourly velocity of 12 miles, which was 1 mile above the nor-

mal. The highest velocity sustained for 5 consecutive minutes, was 50 miles per hour from the southwest at Atlantic City on the 16th. High winds were also noted on the 12th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 20, which was 8 more than the normal; partly cloudy, 6, or 4 less than the normal; cloudy, 5, or 4 less than the normal. The per cent of possible sunshine was 75, which was 15 per cent above the normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 29.97 inches, which was 0.02 below the normal. The highest reading was 30.32 inches at Cape May City and Sandy Hook on the 24th, and the lowest, 29.40 inches at Sandy Hook and Trenton on the 12th.

The mean stage of the Delaware River at Phillipsburg was 4.2 feet, and the highest, 6.0 feet on the 1st and 13th. At Trenton the mean daily stage was 2.7 feet, which was 0.1 foot above the normal; the highest stage was 4.3 feet on the 1st.

Killing frost occurred quite generally over the northern and central portions of the State on the 11th, except along the immediate coast. Charlotteburg also reported killing frost on the 24th. Heavy frost was noted at Trenton, Tuckerton, Lakewood, and New Libson on the 11th, and at New Libson on the 24th; light frost at Elizabeth and Highwood on the 11th, and at Little Falls on the 24th. Thunderstorms occurred in some portion of the State on the 5th, 8th, 9th, 10th, 12th, 16th, 17th, and 21st. Solar halos were observed on the 7th, 8th, 11th, 18th, 20th, 21st, 23d, and 31st. Dense fog occurred on the 6th, 7th, 15th, 16th, 20th, and 28th. Hail fell at Bergen Point on the 9th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Pleasantville is Atlantic City; Ridgefield is Morse-mere; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

## Daily Precipitation for May, 1923.

# CLIMATOLOGICAL DATA

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXVIII.

JUNE, 1923.

No. 6.

### GENERAL SUMMARY.

The month of June was remarkable for its extreme heat and dryness, and excess of sunshine. The average temperature of the entire State exceeded, by a fraction of a degree, the record of any previous June. The extreme highest, 106°, also was a record breaker. The heat occurred in two periods, from the 2d to the 6th, and from the 17th to the 27th, during which daytime readings were very persistently in the upper 80's, 90's, and a few in the 100's. During the second hot wave there was an almost total absence of rain, and crop conditions became very serious as a result, and many wells and springs dried up, thus adding to the agricultural difficulty. The heat practically cancelled the temperature deficiency of the year to date, and the lack of rain further contributed to the year's accumulated precipitation deficiency. There were a few stations, however, in extreme northern counties, where the rainfall was normal or slightly above. The State average was less than in any June since 1912 and 1913. The clearness of the sky was indicated by the record of 100% sunshine for the month in Trenton during the hour of 11 o'clock to noon, standard time. A further contrast in this remarkable month was an occurrence of light frost a few miles to the northwest of Layton, Sussex County in the Delaware valley, on the morning of the 30th. The rain shortage during the crop season, April, May and June, combined, amounted to slightly more than 50%. Hay and grain were prematurely ripening on this account, with indications of a diminished yield in volume.

Out-of-door pursuits were greatly facilitated by the clear weather.

No storm warnings were displayed.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 34 stations, was 72.5°, which was 3.8° above the normal. The highest temperature was 106° at Belle Plain on the 21st, and the lowest, 37° at Belle Plain on the 1st. The highest monthly mean temperature was 75.6° at Bridgeton, Moorestown, and Vineland, and the lowest, 68.4° at Charlotteburg. The greatest daily range of temperature was 47° at Belle Plain on the 14th.

The temperature departure from the normal for the year 1923, to date by sections, is: The Highlands, -0.6°; Red Sandstone Plain, -0.5°; Southern Interior, +0.4°; Sea Coast, -0.1°.

### PRECIPITATION.

The average total rainfall for the State, as deduced from observations of 43 stations, was 2.08 inches, which was 1.70 inches below the normal. The greatest monthly amount was 5.44 inches at Dover, and the least, 0.72 inch at Pleasantville. The greatest amount of rain in 24 consecutive hours was 2.55 inches at Dover on the 6th and 7th. The average number of days on which 0.01 inch or more rain fell was 7 which was 2 less than the normal. The precipitation accumulated departure from the normal for the year 1923, to date, by sections, is: The Highlands, -3.26 inches; Red Sandstone Plain, -4.02 inches; Southern Interior, -2.17 inches; Sea Coast, -2.24 inches.

### WIND.

The prevailing wind direction for the month was from the southwest, with an average velocity of 12 miles per hour, which was 2 miles above the normal. The highest velocity for the month, sustained for five consecutive minutes, was 50 miles per hour from the northwest on the 8th at Atlantic City. High winds were also noted on the 9th and 26th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 18, or 6 more than the normal; partly cloudy, 8, which was 3 less than the normal; cloudy, 4, which was 3 less than the normal. The percentage of possible sunshine was 76, which was 15 per cent more than the normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 1.5 feet, and the highest stage, 3.3 feet on the 10th. At Trenton the mean daily stage was 1.0 foot, which was 0.9 foot below the normal; the highest stage was 2.0 feet on the 10th and 11th.

The mean atmospheric pressure, reduced to sea level, was 29.91 inches, which was 0.07 inch below the normal. The highest reading was 30.26 inches at Cape May City on the 1st, and the lowest, 29.32 inches at Trenton on the 26th.

Thunderstorms occurred in some portions of the State on the 2d, 3d, 4th, 6th, 7th, 8th, 15th, 16th, 21st, 23d, 24th, 25th, 26th, 27th, 28th, and 29th. Solar halos were observed on the 3d, 10th, 11th, 12th, 16th, and 27th. Dense fog occurred on the 18th and 24th.

Light frost occurred at Layton in the northwestern part of Sussex County on the 30th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc. T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Pleasantville is Atlantic City; Ridgefield is Morsemore; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

## Daily Precipitation for June, 1923.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXVIII.

JULY, 1923.

No. 7.

### GENERAL SUMMARY.

The most noticeable feature of July weather in 1923 in New Jersey was the small number of days on which the heat was even slightly above normal. And upon only one or two days was the mean temperature in the 80's. The hottest day was the 21st when the maxima rose in a few localities to slightly above 100°, but on the first day of the month temperatures were in the 40's or 50's throughout the State.

Rainfall was also deficient; although there was no diminution in frequency, the volume was slightly subnormal. This deficiency, added to that of previous months, did not afford much relief from accumulated drought conditions until the last week of the month, when there were several consecutive rainy days which provided some much needed soil moisture. The drought, which has persisted since the early growing season, was relieved somewhat, but only very gradually and almost imperceptibly. The general subsoil water level continued very low, and did not rise appreciably from the scattered rains. As a result, wells and springs were very low, or failed entirely, and many streams became so low as to reveal an impending shortage in urban water supply, and many farmers were obliged to haul water. The greater portion of the rain was attendant upon thundershowers, and there were several instances of severe hail. In one occurrence of hail near Somerville, the stones were about an inch or slightly more in diameter, and caused moderate destruction.

As a rule the weather was more than ordinarily pleasant and favorable for out door activities, and farm work was well in hand. Insect enemies were less injurious than often happens, and while the drought only diminished crop volume, it contributed very appreciably for the harvest of hay and grain under most favorable conditions.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 35 stations, was 71.9°, which was 1.9° below normal. The highest temperature was 102° at Burlington on the 21st, and the lowest, 40° at Charlotteburg on the 1st. The highest monthly mean temperature was 74.8° at Bridgeton, and the lowest, 68.0° at Charlotteburg. The greatest daily range of temperature was 48° at New Brunswick on the 20th. The temperature departure for the year 1923 to date, by sections, is: The Highlands, -0.7°; Red Sandstone Plain, -0.7°; Southern Interior, 0.0°; Sea Coast, -0.2°.

### PRECIPITATION.

The mean total rainfall of the State, as deduced from observations of 42 stations was 3.88 inches, which was 0.68 inch below normal. The greatest monthly rainfall was 6.28 inches at Newark, and the least, 0.93 inch at Woodcliffe Lake. The greatest amount of rain in any 24 consecutive hours was 2.62 inches at Belle Plain on the 28th and 29th. The mean of the number of days on which 0.01 inch or more of rain fell was 11, or 1 more than the normal. The precipitation accumulated departure from normal for the year 1923 to date, by sections, is: The Highlands, -5.02 inches; Red Sandstone Plain, -4.92 inches; Southern Interior, -3.05 inches; Sea Coast, -1.96 inches.

### WIND.

The prevailing wind direction was from the south, with an approximate velocity of 10 miles per hour, which was about normal. The highest velocity, sustained for 5 consecutive minutes, was 42 miles per hour from the northeast on the 6th at Long Branch.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 15, which was 3 more than normal; partly cloudy, 8, or 4 less than normal; cloudy, 8, or 1 more than normal. The approximate percentage of possible sunshine was 64, which was 1 above normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 0.6 foot, and the highest stage, was 3.2 feet on the 28th. At Trenton the mean stage was 0.2 foot, which was 1.1 feet below normal. The highest stage, 1.8 feet, occurred on the 30th.

The mean atmospheric pressure, reduced to sea level, was 30.01 inches, which was 0.03 inch above the normal. The highest reading was 30.43 inches on the 2d, at Cape May City, and the lowest 29.63 on the 25th, at Atlantic City and Sandy Hook.

Thunderstorms occurred in some portions of the State on the 3d, 4th, 5th, 6th, 8th, 10th, 11th, 12th, 14th, 15th, 16th, 17th, 21st, 22d, 23d, 25th, 28th and 29th.

Hail occurred as follows: 4th, little damage at Trenton, Burlington, and Somerville; moderate damage at Bound Brook; 15th, little damage at Lambertville; 22d, little damage at Jamesburg, Moorestown, Newark, and Little Falls; moderate damage at Bound Brook.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, \*, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

## Daily Precipitation for July, 1923.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXVIII.      AUGUST, 1923.      No. 8.

### GENERAL SUMMARY.

The rainfall deficiency, which has been accumulating with notable constancy for several months, continued through August. This factor became emphatic in revealing unlooked for scarcities of water supply in various situations, and in many instances brought about considerable hardship. The lack of rain for the month alone was nothing unusual, as the rainfall for the months of August of as recent years as 1916, 1917, and 1918 was each less than in the year 1923. The deficiency of warmth was not unusual, as is shown by making comparison with 1919 and 1921, when cooler weather prevailed in August. The combination, however, of subnormal warmth and moisture, made the month remarkable, particularly, as oppressive moisture and heat is ordinarily to be expected. A further remarkable feature which has developed is that the rain which has occurred has very steadily been at other times of day than the period of usual working hours, for a period of nearly six months. Contractors have lost practically no time on account of the weather during this period.

The deficiency in warmth was remarkably steady, lasting from the 2d week almost to the close of the month, and the extreme low reading of the State, 35°, was within one degree of the low August record. Scattered occurrences of frost in August were rare phenomena and might have resulted seriously had not the possibility of injury been mitigated by the dry weather.

A further somewhat unusual feature was the persistence and strength of the southwesterly winds.

Storm warnings were displayed on the 21st and 22d.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 36 stations, was 70.8°, which was 1.2° below the normal. The highest temperature was 98° at Little Falls, on the 5th, and the lowest, 35°, at Charlotteburg on the 24th. The highest monthly mean temperature was 74.6° at Vineland, and the lowest, 66.2° at Charlotteburg. The greatest daily range of temperature was 44° at Little Falls on the 26th.

The temperature departure from the normal for the year 1923 to date, by sections, is: The Highlands, -0.8°; Red Sandstone Plain, -0.8°; Southern Interior, -0.2°; Sea Coast, -0.3°.

### PRECIPITATION.

The average total rainfall of the State, as deduced from observations of 41 stations, was 2.44 inches, which was 2.30 inches below the normal. The greatest monthly amount was 4.81 inches at Bridgeton, and the least, 1.23 inches at Little Falls. The greatest amount accumulated in any 24 consecutive hours was 3.10 inches at Bridgeton on the 5th. The average number of days on which .01 inch or more rain fell was 8, which was 2 less than the normal.

The accumulated precipitation departure from the normal for the year 1923 to date, by sections, is: The Highlands, -6.76 inches; Red Sandstone Plain, -7.81 inches; Southern Interior, -5.09 inches; Sea Coast, -4.06 inches.

### WIND.

The prevailing wind movement was from the southwest, with an average velocity of 11 miles per hour, which was 2 miles per hour above the normal. The highest velocity, sustained for 5

consecutive minutes, was 44 miles per hour from the northwest at Atlantic City and Sandy Hook on the 22d.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State, was 17, or 4 more than normal; partly cloudy, 8, or 3 less than the normal; cloudy, 6, or 1 less than the normal. The per cent of possible sunshine was 72, which was 6 per cent more than the normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.00 inches, which was normal. The highest reading was 30.22 inches at Cape May City on the 31st, and the lowest 29.59 inches at Sandy Hook on the 22d.

The mean stage of the Delaware River at Phillipsburg was 0.4 foot; and the highest stage 1.7 feet on the 1st. At Trenton the mean daily stage was 0.2 foot, which was 0.9 foot below the normal. The highest stage was 1.3 feet on the 1st.

Thunderstorms occurred in some portions of the State on the 3d, 4th, 5th, 8th, 12th, 13th, 15th, 19th, 20th, 22d, 27th, 28th, 29th, and 30th. Dense fog was noted on the 3d, 6th, 19th, 27th, and 30th. A lunar halo was observed on the 20th. Light haze prevailed in various localities from the 3d to the 8th, and also on the 11th, 14th, 15th, and 31st. Light frost was reported from Culvers Lake, in northern Sussex County on the 23d, and also in the cranberry bogs on the 24th.

Hail fell, without appreciable damage, at Layton on the 3d, Trenton on the 15th, and Flemington, Lambertville and Jamesburg on the 19th. Severe damage from hail occurred at Belmar on the 15th, and at Hopewell on the 19th. A severe wind storm on the 19th passed from southern Hunterdon County over Hopewell, Freehold, Belmar and out to sea.

### COMPARATIVE DATA FOR AUGUST.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Pleasantville is Atlantic City; Ridgefield is Morsemere; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

Daily Precipitation for August, 1923.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXIX. JANUARY, 1924. No. 1.

### GENERAL SUMMARY.

The year 1924 opened with mostly pleasant winter weather, temperatures averaging appreciably above normal, and with practically no snow. Sunshine was in excess of normal, and ice in ponds was too thin for harvest. Practically the entire rainfall, and what little snow that did fall, occurred in four storms of about an inch or more each, and this comprised the inclement weather of the month. Warmth was notably subnormal on the 5th, 6th, 21st, 22d, 26th and 27th, while there were many days with mean temperatures above 40°. Subzero temperatures occurred only on two days in the extreme northern highlands. The weather was so generally open and favorable, that much out door work on farming and construction projects was carried on with a minimum of interruption. Wind of storm force occurred frequently, and there were some five days when velocities were 50 miles per hour, or more, for brief periods in various localities. The highest velocity, 80 miles per hour, for five minutes, at Atlantic City, occurs but rarely.

Storm warnings were displayed along the coast on the 5th, 6th, 10th, 13th, 16th, 19th, 20th, and from the 22d to 26th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 32.2°, which was 2.2° above the normal. The highest temperature was 65° at Little Falls on the 11th, and the lowest, 6° below zero at Culvers Lake on the 27th. The greatest daily range was 44° at Boonton on the 10th. The highest monthly mean was 35.6° at Cape May City and the lowest, 27.9° at Layton.

The temperature departure from the normal for the year 1924 to date, by sections, is: The Highlands, +2.2°; Red Sandstone Plain, +2.2°; Southern Interior, +2.0°; Sea Coast, +2.1°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 44 stations, was 4.48 inches, which was 0.83 inch above the normal. The greatest monthly precipitation was 5.69 inches at Charlotteburg and the least, 2.88 inches at Sussex. The average total snowfall was 1.4 inches, which was 7.5 inches below the normal; this average ranged from 2.4 inches in the Highlands to a trace along the Sea Coast. The greatest precipitation accumulated in any 24 consecutive hours was 2.09 inches at Charlotteburg on the 16th. The average number of days on which .01 inch or more of precipitation fell was 8, which was 3 less than the normal.

The precipitation accumulated departure from the normal for the year 1924 to date, by sections, is: The Highlands, +0.68 inch; Red Sandstone Plain, + 0.98 inch; Southern Interior, +0.90 inch; Sea Coast, +0.50 inch.

### WIND.

The prevailing wind direction was from the northwest, which was normal. The wind movement was 16 miles per hour, which was 2 miles above the normal. The highest velocity, sustained for 5 consecutive minutes, was 80 miles per hour from the southeast at Atlantic City on the 16th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 15, which was five more than the normal; partly cloudy, 8 or 1 less than the normal; cloudy, 8, or 4 less than the normal. The per cent of possible sunshine was 61, which was 11 per cent above the normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.20 inches, which was 0.09 inch above the normal. The highest reading was 30.83 inches at Sandy Hook on the 2d, and the lowest, 29.36 inches at Sandy Hook on the 11th.

The mean stage of the Delaware River at Phillipsburg was 5.2 feet, and the highest 12.0 feet on the 12th. At Trenton the mean daily stage was 4.1 feet, which was 0.6 feet above the normal. The highest stage was 8.0 feet on the 13th, and the lowest, 1.8 feet on the 11th.

Dense fog occurred on the 1st and 11th. Sleet was reported on the 2d and the 24th. Solar halos were observed on the 10th, 13th, 19th, 22d, 25th, 28th, and 30th. Lunas halos were observed on the 15th, 17th, and 19th. No thunderstorms were reported.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Pleasantville is Atlantic City; Indian Mills is Atsion; New Milford and Woodcliffe Lake are Weehawken; Northfield is Pleasantville.

Daily Precipitation for January, 1924.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXIX.

FEBRUARY, 1924.

No. 2.

### GENERAL SUMMARY.

February opened with six consecutive days somewhat warmer than normal, but thereafter with but little exception, it was colder than normal. Up to the 10th of the month, snow was consistently lacking, thereafter however it occurred frequently, but in small volume. The earlier impression of a mild and open winter was quickly changed to a realization that February often provides the most rigorous of winter conditions. There were no especially severe storms except that of the 19-20th; this storm started as snow in the evening of the 19th, and turned to rain during the early hours of the 20th. Considerable local damage was caused by the rapid melting of the snow and accumulation of rain. Up to this storm there had been but little ice harvest, especially in central and southern regions, but with freezing weather, following the storm, a fairly satisfactory supply of ice was housed.

Precipitation was somewhat below normal over the northern half of the State, especially in Sussex County, and the greatest excess was in the southern interior.

Storm warnings were displayed along the coast on the 4th, 19th to 21st, 26th and 27th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations, was 28.9°, which was 1.0° below the normal. The highest temperature was 62° at Bridgeton on the 4th, and the lowest, 3° below zero, at Layton on the 25th. The greatest daily range of temperature was 45° at Layton on the 25th. The highest monthly mean was 33.6° at Cape May City, and the lowest, 24.6° at Layton and Newton.

The temperature departure from the normal for the year 1924 to date, by sections, is: The Highlands, +0.8°; Red Sandstone Plain, +0.4°; Southern Interior, +0.6°; Sea Coast, +0.5°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 38 stations, was 4.10 inches, which was 0.40 inch above the normal. The greatest monthly precipitation was 6.11 inches at Indian Mills, and the least 2.45 inches at Newton. The average total snowfall at 19 selected stations was 11.9 inches, which was 2.6 inches above the normal; this average depth ranged from 16.0 inches in the Highlands to 9.2 inches on the Sea Coast. The greatest precipitation accumulated in any 24 consecutive hours was 3.45 inches at Vineland on the 19-20th. The average number of days on which 0.01 inch or more of precipitation fell was 9, which was normal.

The precipitation accumulated departure from the normal for the year 1924 to date, by sections, is: The Highlands, +0.18 inch; Red Sandstone Plain, +1.20 inches; Southern Interior, +2.03 inches; Sea Coast, +1.06 inches.

### WIND.

The prevailing wind direction was from the northwest, with an average velocity of 15 miles per hour, which was 1 mile above

the normal. The highest wind velocity, sustained for 5 consecutive minutes, was 68 miles per hour from the southeast at Atlantic City on the 20th. High winds were noted also on the 5th and 21st.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was 2 more than the normal; partly cloudy days, 5, which was 4 less than the normal; cloudy days, 11, which was 2 more than the normal. The per cent of possible sunshine was 59, which was 3 per cent above the normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.08 inches, which was 0.02 inch below the normal. The highest reading was 30.71 inches at Sandy Hook on the 19th and Cape May City on the 24th, and the lowest, 29.51 inches at Atlantic City on the 5th and Sandy Hook on the 20th.

The mean stage of the Delaware River at Phillipsburg was 2.1 feet, and the highest stage was 3.5 feet on the 6th. At Trenton the mean stage was 1.9 feet, which was 1.4 feet below the normal. The highest stage was 5.5 feet on the 1st.

Dense fog occurred on the 5th, 6th, and 20th. Sleet was observed at a few stations on the 4th, 6th, 12th, 17th, 18th, and 21st, in the northern half of the State on the 5th, at scattered points on the 19th, and quite generally throughout the State on the 20th. Solar halos were noted on the 9th, 11th, 17th, 18th, 24th, 25th, 26th, and 27th, and lunar halos on the 11th and 19th. Thunderstorms occurred in southern counties on the 5th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Pleasantville is Atlantic City; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXIX.

MARCH, 1924.

No. 3.

### GENERAL SUMMARY.

The weather during March was more than ordinarily typical of the transition period from winter to spring. Warmth was normal, and there was a slight excess of sunshine and clear sky. On the other hand the pressure was nearly a quarter of an inch subnormal, and this was made up largely of successive periods of low pressure without notable extremes. As would ordinarily follow, the wind movement was great and high velocities were frequent and at times very continuous. During the month there were some ten days with wind velocities reaching 40 miles or more per hour in the interior, and more frequent occurrences and higher velocities prevailed at the coast. The greatest period of consecutive gales was from the 7th to the 11th, and 15th to 17th, inclusive. Reactions toward the milder conditions of spring were almost entirely lacking, and the feeling of winter in the air persisted to the close of the month, particularly at night.

Temperatures were slightly above normal the first and last decades of the month, and subnormal during the middle decade.

There were moderate excesses of rain over the southeastern quarter of the State, but the deficiencies elsewhere more than overcame the difference, and natural water resources were not up to normal levels.

Storm warnings were displayed along the coast on the 8th, 10th, 11th, 12th, 20th, 21st, 26th, and 29th.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 37 stations was 38.8°, which was normal. The highest temperature was 76° at Pleasantville on the 30th, and the lowest, 5°, at Layton on the 2d. The highest monthly mean temperature was 41.6° at Clayton, and the lowest, 35.1° at Charlotteburg. The greatest daily range of temperature was 45° at Pleasantville on the 28th.

The temperature departure from the normal for the year 1924 to date by sections, is: The Highlands, +0.3°; Red Sandstone Plain, +0.3°; Southern Interior, +0.2°; Sea Coast, +0.5°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 45 stations was 2.51 inches, which was 1.32 inches below the normal. The greatest monthly precipitation was 5.69 inches at Tuckerton, and the least, 0.80 inch at Woodcliff Lake. The average total snowfall of 19 selected stations was 2.7 inches, which was 3.2 inches below the normal; this average ranged from 4.5 inches in the Highlands to 0.2 inch on the Sea Coast. The greatest precipitation accumulated in any 24 consecutive hours was 3.80 inches at Tuckerton on the 11-12th. The average number of days on which .01 inch or more of precipitation fell was 8, which was 3 less than the normal.

The precipitation accumulated departure for the year 1924 to date by sections, is: The Highlands, -2.11 inches; Red Sandstone Plain, -0.84 inch; Southern Interior, +1.79 inches; Sea Coast, +0.06 inch.

### WIND.

The prevailing wind direction was from the northwest, with an average velocity of 17 miles per hour, which was 2 miles above the normal. The highest wind velocity, sustained for 5

consecutive minutes, was 88 miles per hour from the northeast on the 11th at Atlantic City. Other dates with high winds were the 7th, 8th, 10th, 15th, 16th, 17th, 21st, and 30th.

### SUNSHINE AND CLOUDINESS.

The mean of the number of clear days throughout the State was 16, which was 2 more than the normal; partly cloudy, 6, which was 2 less than the normal; cloudy, 9, or normal. The mean per cent of possible sunshine was 64, which was 3 per cent above the normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 3.5 feet, and the highest, 7.0 feet on the 31st. At Trenton the mean daily stage was 2.4 feet, which was 1.7 feet below the normal; the highest stage was 4.6 feet on the 30th.

The mean atmospheric pressure, reduced to sea level, was 29.79 inches, which was 0.22 inch below the normal. The highest reading was 30.23 inches at Trenton on the 31st, and the lowest, 28.94 inches at Atlantic City on the 11th.

Dense fog was reported on the 3d, 5th, 6th, 7th, 8th, and 30th. Sleet occurred in portions of northern and central districts on the 11th and 26th. A thunderstorm was recorded at all but a few southern stations during the night of the 29-30th. Light hail fell during the thunderstorm at a few stations.

### MR. SAMUEL J. HIXSON.

Mr. Samuel J. Hixson, cooperative observer at Belvidere, N. J., since July 1, 1891, died on January 23d, 1924, in his 91st year. His generous devotion to a self imposed duty which he efficiently fulfilled, is worthy of thoughtful consideration and emulation.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Pleasantville is Atlantic City; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

Daily Precipitation for March, 1924.

CLIMATOLOGICAL DATA.

NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

Vol. XXIX. APRIL, 1924. No. 4.

GENERAL SUMMARY.

April opened with a snowstorm which covered the entire state with from two to ten inches of snow, averaging some six and a half inches. Heavy rains on the 6th-7th, and 18th, were features which largely contributed to the record breaking precipitation for April of this year. In 1901 the April record slightly exceeded that of this year, but by a negligible quantity.

The snow of the 1st did a considerable amount of damage to trees, shrubs, and electric wires, and handicapped highway traffic for a few hours. The rain of the 6th-7th caused a rise in the Delaware River to the highest stages reached since March 1914, but there was no great amount of flood damage. Floods occurred in the upper reaches of the Passaic river system, with moderate resulting damage. Frequency of occurrence of rain was not significantly above normal.

Low average temperature with the excessive precipitation resulted in a decided setback to growth of vegetation, checked germination, and substantially interfered with all forms of outdoor work, so that the advance of spring was approximately two week late.

The weather was mostly fairly warm and pleasant on the 4th, 5th, from the 11th to the 15th, and on the 27th and 28th, on other dates it was either rainy or subnormally cool. The highest average temperatures occurred over the lower Passaic and the southwestern counties; the areas of heaviest precipitation were, in a general way, about midway in the State from Passaic county to the northwestern portion of Cape May County.

Storm warnings were displayed along the coast on the 1st, 6th, 7th, 20th to 22d, and 30th.

TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations was 48.0°, which was 1.5° below the normal. The highest temperature was 81° at Pleasantville on the 14th and Burlington on the 28th, and the lowest, 18° at Culvers Lake on the 1st. The highest monthly mean temperature was 50.8° at Vineland, and the lowest, 44.3° at Layton. The greatest daily range of temperature was 45° at Tuckerton on the 27th and Sussex on the 28th. The temperature departure from the normal for the year 1924 to date, by sections, is; The Highlands, -0.2°; Red Sandstone Plain, -0.2°; Southern Interior, -0.3°; Sea Coast, +0.3°.

PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 46 stations was 6.15 inches, which was 2.50 inches above the normal. The average total snowfall at 20 selected stations was 6.6 inches, which was 5.1 inches above the normal; this average depth ranged from 9.8 inches in the Highlands to 1.6 inches on the Sea Coast. The greatest monthly precipitation was 9.23 inches at Chatham, and the least 4.74 inches at Paterson. The greatest amount of precipitation in any 24 consecutive hours was 4.05 inches at Charlotteburg and Chatham on the 6-7th. The mean number of days on which 0.01 inch or more of precipitation occurred was 11, or 1 more than the normal.

The precipitation accumulated departure from the normal for the year 1924 to date, by sections, is: The Highlands, +0.20

inch; Red Sandstone Plain, +1.94 inches; Southern Interior, +0.74 inch; Sea Coast, +1.96 inches.

WIND.

The prevailing wind direction was from the northwest, with an average velocity of 15 miles per hour, which was 2 miles above the normal. The highest velocity sustained for 5 consecutive minutes, was 70 miles per hour from the northeast at Atlantic City on the 1st. High winds were noted also on the 2d, 7th, 8th, 14th, 19th, 20th, 22d, and 23d.

SUNSHINE AND CLOUDINESS.

The mean of the number of clear days throughout the State was 15, which was 4 more than the normal; partly cloudy, 6, which was 4 less than the normal; cloudy, 9, or normal. The per cent of possible sunshine was 64, which was 7 per cent above the normal.

MISCELLANEOUS.

The mean daily stage of the Delaware River at Phillipsburg was 7.2 feet, and the highest stage, 20.0 feet on the 8th. At Trenton the mean stage was 4.5 feet, which was 0.3 foot above the normal; the highest stage was 11.7 feet on the 8th.

Sleet occurred at a few scattered stations on the 1st, 7th, and 17th. Solar halos were observed on the 7th, 9th, 10th, 11th, 12th, 13th, 15th, 21st, 22d, 27th, and 28th; lunar halos on the 11th and 12th. Thunderstorms occurred in some portions of the State on the 1st, 6th, 18th, 20th, 22d, 29th, and 30th.

Unimportant occurrences of hail were noted at Lamertville, Rahway and Trenton on the 20th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete records are used in determining section or division means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Pleasantville is Atlantic City; Indian Mills is Afton; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

## Daily Precipitation for April, 1924

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXIX.

MAY, 1924.

No. 5.

### GENERAL SUMMARY.

Subnormal warmth and excessive rains, which prevailed in April, continued throughout May, so that weather conditions, cumulatively, assumed an unprecedentedly unfavorable aspect. The low temperature, the amount and frequency of rain and consecutive cloudy days have rarely been equalled singly, and never in combination. It has probably been the worst spring since 1886, which was also cold and damp. There are no tabulated records prior to 1885 of the State as a whole. The greatest departure of temperature below normal occurred in the northern counties and mid-interior. The excess of rainfall was generally Statewide, except along the extreme southeast coast where it was slightly above normal. There was a period from the 2d to the 7th practically without rain, but thereafter it rained almost daily, although there were a few lapses of one or two days at a time without rain. Only about five to seven days were of normal temperature or warmer. Frost occurred early in the month at many central and northern places, and also at the close of the month in the extreme north and in the cranberry marshes.

The unfavorable weather has been exceedingly detrimental to farm work and crop growth, and the season was generally considered to be two to three weeks late. Considerable corn had not been planted at the close of the month, and some farmers stated that they had never planted corn in June, which this year would be commonly done.

Storm warnings were displayed along the coast on the 3d, 7th, 11th, 18th, and 24th.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 39 stations, was 56° 8', which was 3.7° below the normal. The highest temperature was 87° at Bridgeton, Burlington, and Indian Mills on the 6th, and the lowest, 25° at Charlotteburg. The greatest daily range of temperature was 46° at Imlaystown on the 6th.

The temperature departure from the normal for the year 1924 to date, by sections, is: The Highlands, -1.1°; Red Sandstone Plain, -0.9°; Southern Interior, -0.9°; Sea Coast, -0.1°.

### PRECIPITATION.

The average total precipitation for the State, as deduced from observations of 43 stations, was 5.69 inches, which was 1.96 inches above the normal. The greatest monthly amount was 7.94 inches at Little Falls, and the least, 3.36 inches at Atlantic City. The greatest amount accumulated in any 24 consecutive hours was 2.59 inches at Newark on the 9th. The average number of days on which 0.01 inch or more of rain fell was 17, which was 6 more than the normal.

The accumulated precipitation departure from the normal for the year 1924 to date, by sections, is: The Highlands, +1.92 inches; Red Sandstone Plain, +4.51 inches; Southern Interior, +6.00 inches; Sea Coast, +1.92 inches.

### WIND.

The prevailing wind direction was from the west, with an average velocity of 14 miles per hour, which was 3 miles above the normal. The highest velocity sustained for 5 consecutive minutes, was 56 miles per hour from the northeast at Long Branch on the 11th, and from the south at Sandy Hook on the 24th. High winds were noted also on the 12th, 18th, and 20th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 12, or normal; partly cloudy, 7, which was 3 less than the normal; cloudy, 12, which was 3 more than the normal. The per cent of possible sunshine was 57, which was 3 per cent below the normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 29.87 inches, which was 0.12 inch below the normal. The highest reading was 30.22 inches at Sandy Hook on the 10th, and the lowest, 29.31 inches at Sandy Hook on the 1st.

The mean stage of the Delaware River at Phillipsburg was 5.4 feet, and the highest, 10.0 feet on the 14th. At Trenton the mean daily stage was 3.5 feet, which was 0.9 foot above the normal; the highest stage was 6.0 feet on the 14th.

Killing frost occurred quite generally over the northern districts, and at scattered points in the central counties on the 2d and 5th. Heavy frost was noted at Flemington and Lakewood on the 2d and 5th, Indian Mills and Whitesbog on the 23d, and at Layton on the 31st; light frost at Lambertville, Burlington, Pleasantville, and Long Branch on the 5th, and at Whitesbog on the 31st. Thunderstorms occurred in some portions of the State on the 1st, 3d, 6th, 7th, 8th, 9th, 11th, 12th, 15th, 16th, 18th, 24th, and 25th. Dense fog occurred on the 7th, 8th, and 28th. Solar halos were observed on the 14th, 15th, 23d, and 29th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Pleasantville is Atlantic City; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXIX.

JUNE, 1924.

No. 6

### GENERAL SUMMARY.

June in New Jersey is a month of very great possibilities in extremes of rain and temperature. Rain has varied in previous years from four-tenths of an inch to fifteen inches, and temperature from 30° to 106°. This year the record of 30° occurred, and the mean temperature was low, although the years of 1910, 1915, 1916 and 1918, were as cool or cooler. But this June was in marked contrast to last June, which was the warmest on record. Rain was not sufficiently in excess to arouse comment, but, in connection with previous wet months, it afforded more than a desirable quantity of soil moisture for the best conditions of plant growth. The frequency of rain was somewhat greater than normal, although under the extreme record, and was distributed through the month with fair regularity. Much less rain fell in the northern half of the State and along the northern and southern seaboard counties than elsewhere, and deficiencies were apparent from Somerset County northward.

The outstanding feature of the month was the storm in the afternoon of the 25th, following the extreme high temperature of the season and in connection with the lowest barometric pressure. Heavy downpours of rain with violent squalls did considerable damage of a minor character, such as injury to vegetation, tree and shrub foliage, and disrupting or straining of insecure buildings, and moderate washouts in scattered localities.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations was 66.8°, which was 1.8° below the normal. The highest temperature was 95° at Little Falls and Newark on the 25th, and the lowest, 30° at Charlotteburg on the 1st. The highest monthly mean temperature was 70.0° at Vineland, and the lowest, 63.6° at Charlotteburg. The greatest daily range of temperature was 42° at Charlotteburg on the 22d.

The temperature departure from the normal for the year 1924 to date, by sections, is: The Highlands, -1.2°; Red Sandstone Plain, -1.1°; Southern Interior, -1.1°; Sea Coast, -0.3°.

### PRECIPITATION.

The average total rainfall for the State, as deduced from observations of 42 stations, was 4.20 inches, which was 0.48 inch above the normal. The greatest monthly amount was 7.32 inches at Imlaystown, and the least, 1.72 inches at Charlotteburg. The greatest amount of rain in any 24 consecutive hours was 2.44 inches at Chatham on the 26th. The average number of days on which 0.01 inch or more rain fell was 13, which was 4 more than the normal. The precipitation accumulated departure from the normal for the year 1924, to date, by sections, is: The Highlands, +0.69 inch; Red Sandstone Plain, +4.53 inches; Southern Interior, +7.97 inches; Sea Coast, +2.01 inches.

### WIND.

The prevailing wind direction for the month was from the southwest, with an average velocity of 10 miles per hour, which was 2 miles below the normal. The highest velocity for the month, sustained for 5 consecutive minutes, was 62 miles per hour from the northwest on the 25th at Trenton.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was

11, which was 1 less than the normal; partly cloudy, 11, or normal; cloudy, 8, which was 1 more than the normal. The per cent of possible sunshine was 58, which was 3 per cent below the normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 2.3 feet, and the highest stage, 3.8 feet on the 1st. At Trenton the mean daily stage was 1.5 feet, which was 0.4 foot below the normal; the highest stage was 2.4 feet on the 1st.

The mean atmospheric pressure, reduced to sea level, was 29.96 inches, which was 0.02 inch below the normal. The highest reading was 30.34 inches at Sandy Hook on the 11th, and the lowest, 29.55 inches at Sandy Hook and Trenton on the 25th.

Thunderstorms occurred in some portions of the State on the 4th, 6th, 7th, 8th, daily from the 13th to 21st, inclusive, 23d, 24th, 25th, 29th, and 30th. Dense fog occurred on the 7th, 8th, and daily from the 18th to 21st, inclusive. Solar halos were observed on the 1st, 3d, 5th, 6th, 10th, 11th, and 22d, and a lunar halo on the 15th. The aurora was visible at Sandy Hook on the 10th. Frost or freezing temperature occurred at Dover, Charlotteburg, and Layton on the 1st. Hail in light amounts fell at Lambertville on the 7th, Elizabeth on the 14th, Imlaystown on the 20th, and Paterson, Phillipsburg, and Rahway on the 25th.

### OBITUARY.

Mr. Frank R. Austin who opened the station at Tuckerton May 1st, 1898, and continued the observations there ever since, died June 30th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

Daily Precipitation for June, 1924

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXIX.

JULY, 1924.

No. 7

### GENERAL SUMMARY.

The weather during July was unusually pleasant and fine for all out door interests, except for crop growth. There were brief warm periods from the 7th to the 12th, on the 23d, 24th, and 30th, but at other times, temperatures were normal or more generally below. In no case was there appreciable rain on more than two consecutive days, and in many cases rain fell at night, leaving daylight hours uninterrupted for profitable occupation.

There was a great shortage of rain in all portions of the State. In many portions of central districts generous total rainfall was recorded, but the fall occurred mostly on the 8th, when amounts up to and above 4 inches were measured in the 24-hour period. The runoff from this storm was so rapid that no very lasting good to vegetation occurred, and did not prevent a latter deterioration in plant growth. On other days amounts were so small, that in spite of the fairly large monthly total, a virtual drought prevailed at the close of the month.

A low barometric area passed the State on the 17th, and a sharp squall occurred which was seriously destructive in scattered localities. In some sections the damage occurred from wind and in others from hail. In a part of Cumberland County the hail cut some fields to shreds, with a resulting total loss.

The weather afforded one of the best seasons for harvest of hay and grain in a long period of years, but otherwise it was an unfavorable month for agriculture.

No storm warnings were displayed along the coast.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 37 stations, was 71.6°, which was 1.6° below the normal. The highest temperature was 98° at Little Falls on the 30th, and the lowest, 41° at Belle Plain on the 19th and Charlotteburg on the 20th. The highest monthly mean temperature was 74.8° at Bridgeton and Paterson, and the lowest, 68.0° at Charlotteburg. The greatest daily range of temperature was 44° at Layton on the 28th and Belle Plain on the 29th. The temperature departure for the year 1924 to date, by sections, is: The Highlands, -1.3°; Red Sandstone Plain, -1.2°; Southern Interior, -1.2°; Sea Coast, -0.4°.

### PRECIPITATION.

The mean total rainfall of the State, as deduced from observations of 42 stations was 2.59 inches, which was 2.05 inches below the normal. The greatest monthly rainfall was 5.08 inches at Somerville, and the least, 0.84 inch at Belle Plain. The greatest amount of rain in any 24 consecutive hours was 4.09 inches at Chatham on the 9th. The mean of the number of days on which 0.01 inch or more of rain fell was 6, or 4 less than the normal. The precipitation accumulated departure from the normal for the year 1924 to date, by sections, is: The Highlands, -1.34 inches; Red Sandstone Plain, +2.98 inches; Southern Interior, +5.81 inches; Sea Coast, -1.17 inches.

### WIND.

The prevailing wind direction was from the south, with an average velocity of 10 miles per hour, which was about normal. The highest velocity, sustained for 5 consecutive minutes, was 56 miles per hour from the northwest on the 17th at Sandy Hook.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 19, which was 7 more than the normal; partly cloudy, 8, or 4 less than the normal; cloudy, 4, or 3 less than the normal. The per cent of possible sunshine was 73, which was 10 per cent above the normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 1.7 feet, and the highest stage was 3.8 feet on the 9th. At Trenton the mean stage was 1.0 foot, which was 0.3 foot below the normal. The highest stage, 2.2 feet, occurred on the 11th.

The mean atmospheric pressure, reduced to sea level, was 30.01 inches, which was 0.03 inch above the normal. The highest reading was 30.29 inches on the 6th at Cape May City, and the lowest, 29.58 inches on the 17th at Sandy Hook.

Thunderstorms occurred in some portions of the State on the 7th, 8th, 10th, 13th, 14th, 17th, 22d, 23d, 25th, 30th, and 31st. Solar halos were observed on the 4th, 17th, 21st, and 28th. Dense fog occurred on the 6th, 7th, 16th, and 21st.

Considerable damage was done by hail on the 17th in the vicinity of Bridgeton and Millville, and little damage occurred at Forked River and Hammonton.

### COMPARATIVE DATA FOR JULY

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

Daily Precipitation for July, 1924

## NEW JERSEY SECTION.

THE LIBRARY OF THE

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

SEP 26 1924

VOL. XXIX.

AUGUST, 1924.

UNIVERSITY OF ILLINOIS  
No. 8

### GENERAL SUMMARY.

The general weather conditions during August averaged about normal, although there were several unusual features which occasioned comment. There were warm periods from the 5th to the 11th, and again from the 27th through the close of the month. On the 6th temperatures rose above 100° in localities favorable for excessive warmth. It was cool from the 1st to the 4th, and again from the 12th to the 23d. Rain, both in volume and frequency, was slightly deficient and by far the major portion of it fell during the occurrence of two tropical storms which moved along the coast, the first on the 12th, and the other on the 25-26th. During these storms rain fell almost everywhere in excess of an inch, and in some instances exceeded four inches in 24 hours. More than the usual amount of sunshine and clear sky was recorded, and the month was more than ordinarily favorable for all out-of-door interests. The frequent periods of oppressive humidity usually experienced in August were almost entirely lacking, and this may have been a contributing factor toward hindering the best development of crop growth, but weather conditions were especially favorable for the harvest of hay and grain.

The locations of stations with temperatures above and below the monthly normal were indiscriminately scattered over the State. The region of heaviest rainfall extended diagonally across the State from Mercer County to Sandy Hook Bay and Bergen County.

Storm warnings were displayed along the coast on the 25th and 26th.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 35 stations, was 71.9°, which was normal. The highest temperature was 102° at Indian Mills on the 6th, and the lowest, 38° at Runyon on the 19th. The highest monthly mean temperature was 75.2° at Vineland, and the lowest 68.2° at Charlotteburg. The greatest daily range of temperature was 44° at Layton on the 31st.

The temperature departure from the normal for the year 1924 to date, by sections, is: The Highlands, -1.1°; Red Sandstone Plain, -1.0°; Southern Interior, -1.0°; Sea Coast, -0.3°.

### PRECIPITATION.

The average total rainfall of the State, as deduced from observations of 41 stations, was 4.40 inches, which was 0.50 inch below the normal. The greatest monthly amount was 9.48 inches at Runyon, and the least, 1.82 inches at Charlotteburg. The greatest amount accumulated in any 24 consecutive hours was 4.35 inches at Runyon on the 12th. The average number of days on which 0.01 inch or more fell was 8, which was 2 less than the normal.

The accumulated precipitation departure from the normal for the year 1924 to date, by sections, is: The Highlands, -2.97 inches; Red Sandstone Plain, +3.47 inches; Southern Interior, +5.06 inches; Sea Coast, -2.09 inches.

### WIND.

The prevailing wind direction was from the southwest, with an average velocity of 10 miles per hour, which was 1 mile per hour above the normal. The highest velocity, sustained for 5 consecutive minutes, was 72 miles per hour from the north at Atlantic City on the 26th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 18, or 5 more than the normal; partly cloudy, 8, or 3 less than the normal; cloudy, 5, or 2 less than the normal. The per cent of possible sunshine was 70, which was 4 per cent more than the normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 29.99 inches, which was 0.01 inch below the normal. The highest reading was 30.29 inches at Cape May City, Sandy Hook, and Trenton on the 4th, and the lowest 29.30 inches at Atlantic City on the 26th.

The mean stage of the Delaware River at Phillipsburg was 0.5 foot; and the highest stage 1.1 feet on the 14th. At Trenton the mean daily stage was 0.2 foot, which was 0.9 foot below the normal. The highest stage was 0.8 foot on the 14th.

Thunderstorms occurred in some portions of the State on the 5th, 6th, 7th, 8th, 9th, 10th, 11th, 12th, 13th, 17th, 21st, 23d, 24th, 25th, and 26th. Dense fog was noted on the 6th, 13th, and 24th. Solar halos were observed on the 11th, 14th, 19th, and 25th, and lunar halos on the 6th and 8th.

Hail fell, without appreciable damage, at Somerville on the 9th, and at Copper Hill on the 10th.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc. T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

Daily Precipitation for August, 1924

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXIX.

SEPTEMBER, 1924.

No. 9

### GENERAL SUMMARY.

The month opened with maxima well up in the 90's and it continued warm on the 2d. Warmth was slightly above normal on the 13th, 28th and 29th. The remainder of the month was cool, so that the mean monthly temperature was one of the lowest of September records. In 1887 and in 1917 it was a fraction of a degree cooler. There were several days when the minima reached the low record of the season, and frosts, especially in the cranberry bogs were of frequent occurrence, and for this reason it was a particularly hazardous season for agriculture in locations easily susceptible to frost formation. It was very uniformly fortunate, however, that there was little or no frost damage.

Sunshine was deficient, and the rapid curing of late cuttings of grass and alfalfa and the maturing of corn were substantially delayed. Rain was slightly more frequent than usual, and occurred in generous volume, except in the district from the Monmouth County shore to New York Harbor. It was the rainiest September since 1907, and has been appreciably exceeded only in four Septembers since 1885. It was of great enough volume to bring the year's fall to normal in extreme northern regions, and substantially increased the surplus in the interior of the state. The rainstorm at the close of the month in extreme northwestern sections, amounted to nearly 5.8 inches in about 24 hours, and this, with like heavy rain in adjacent territory of New York and Pennsylvania started a flood in the Delaware River which indicated a threatening aspect by midnight at the close of the month.

The soil was mostly in fine condition for fall plowing and seeding, and weather conditions interfered but little with outdoor work.

Storm warnings were displayed along shore on the 5th, 9th, 16th, 29th, and 30th.

### TEMPERATURE.

The mean monthly temperature of the State, as deduced from observations of 34 stations, was 62.2°, which was 3.4° below the normal. The highest temperature was 99° at Moorestown on the 1st, and the lowest, 29° at Charlotteburg on the 26th. The highest monthly mean temperature was 65.9° at Vineland, and the lowest, 58.1° at Charlotteburg. The greatest daily range of temperature was 42° at Runyon on the 12th.

The temperature departure from the normal for the year 1924 to date, by sections, is: The Highlands, -1.4°; Red Sandstone Plain, -1.3°; Southern Interior, -1.2°; Sea Coast, -0.7°.

### PRECIPITATION.

The mean total rainfall of the State, as deduced from observations of 42 stations, was 5.42 inches, which was 1.83 inches above the normal. The greatest monthly rainfall was 8.44 inches at Layton, and the least, 2.47 inches at Sandy Hook. The greatest amount of rain in any 24 consecutive hours was 5.24 inches at Layton on the 30th. The mean of the number of days on which .01 inch or more of rain fell was 10, or 2 more

than the normal.

The precipitation departure from the normal for the year 1924 to date, by sections, is: The Highlands, -46.01 inch; Red Sandstone Plain, +5.11 inches; Southern Interior, +6.79 inches; Sea Coast, -1.82 inches.

### WIND.

The prevailing wind direction was from the southwest, with an average velocity of 14 miles per hour, which was 2 miles above the normal. The highest velocity, sustained for 5 consecutive minutes, was 82 miles per hour from the southeast on the 30th at Atlantic City.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 13, which was 1 less than the normal; partly cloudy, 8, or, 1 less than the normal; cloudy, 9, or 2 more than the normal. The per cent of possible sunshine was 57, which was 11 per cent below the normal.

### MISCELLANEOUS.

The mean stage of the Delaware River at Phillipsburg was 1.1 feet, and the highest, 4.7 feet on the 30th. At Trenton the mean stage was 0.2 foot, which was 0.9 foot below the normal. The highest stage, 1.1 feet, occurred on the 13th.

### ERRATA.

August, 1924: Atlantic City, greatest 24-hour precipitation should read 2.66 inches instead of 2.27 inches. Bergen Point, rainfall on the 12th should read 2.22 inches instead of 2.15 inches, and on the 25th 1.36 inches instead of 1.30 inches; greatest 24 hour rainfall, 3.06 instead of 3.00; monthly total rainfall, 5.63 instead of 5.50.

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, \*, †, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville.

VOL. XXIX.

OCTOBER, 1924.

No. 10

### GENERAL SUMMARY.

Heavy rains at the close of September, particularly in the headwaters of northern streams, caused one of the heaviest floods in the Delaware of recent record. The crest of the flood passed out of the Delaware into tide water at Trenton between midnight and 3 A. M., of the 2d, reaching an estimated height of 12.5 feet. This was the highest stage at Trenton since March 29, 1914. The highest stage at Phillipsburg, 22.0 feet on the 1st, exceeded all floods since 1903. Considerable damage was done from overflow and washing, not very large in any single instance, but large in the aggregate. This flood was notable as resulting entirely from rain, and was not augmented by ice jams, such as usually occur with spring floods.

No further rain fell until a light shower on the early morning of the 8th, and none thereafter through the close of the month. This gives the driest month on record, and the longest period without rain on record. At seven stations the rainfall was less than a tenth of an inch. A few stations where observations are recorded in the morning have, of necessity, entered a record of rain on the 1st, but these amounts actually occurred at the close of the September 30th storm. Omitting these entries from the computations, it would leave about 0.2 inch as the monthly rainfall for the State and also for the Red Sandstone Plain. Coming at the close of the crop season the drought had little adverse effect, except that it interfered with plowing and checked germination of late sown grass and grain. In the forests, however, the fire hazard greatly increased, and numerous fires were continually breaking out in the later portions of the month.

Temperature conditions were approximately normal. As would be expected, the number of clear days and amount of sunshine far exceeded normal.

No storm warnings were displayed along the coast.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 37 stations, was 54.4°, which was 0.4° below the normal. The highest temperature was 84° at Indian Mills on the 6th, and the lowest, 16° at Runyon on the 23d. The highest monthly mean temperature was 58.4° at Cape May City, and the lowest, 50.2° at Charlotteburg and Layton. The greatest daily range of temperature was 50° at Sussex on the 27th.

The temperature departure from the normal for the year 1924, to date, by sections, is: The Highlands, -1.3°; Red Sandstone Plain, -1.2°; Southern Interior, -1.1°; Sea Coast, -0.7°.

### PRECIPITATION.

The mean total rainfall of the State, as deduced from observations of 40 stations, was 0.31 inch, which was 3.39 inches below the normal. The greatest monthly rainfall was 2.76 inches at Little Falls, and the least, 0.04 inch at Phillipsburg. The greatest amount of rain in any 24 consecutive hours was 2.52 inches at Little Falls on September 30th-October 1st. The mean of the number of days on which 0.01 inch or more of rain fell was 1, which was 7 less than the normal.

The precipitation accumulated departure from the normal for the year 1924 to date, by sections, is: The Highlands, -3.70 inches; Red Sandstone Plain, +1.78 inches; Southern Interior, +3.45 inches; Sea Coast, -4.61 inches.

### WIND.

The prevailing wind direction was from the northwest, with an average velocity of 10 miles per hour, which was 2 miles below the normal. The highest velocity, sustained for 5 consecutive minutes, was 46 miles per hour from the northwest at Sandy Hook on the 20th. High winds occurred also on the 1st and 29th.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 23, or 9 more than the normal; partly cloudy, 6, or 2 less than the normal; cloudy, 2, or 7 less than the normal. The per cent of possible sunshine was 84, which was 21 per cent above the normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.20 inches, which was 0.13 inch above the normal. The highest reading was 30.58 inches at Sandy Hook on the 30th and Cape May City on the 31st, and the lowest 29.78 inches at Sandy Hook on the 20th.

The mean stage of the Delaware River at Phillipsburg was 2.2 feet, and the highest stage, 22.0 feet on the 1st. At Trenton the mean stage was 2.1 feet, which was 0.7 foot above the normal. The highest stage, 12.5 feet, occurred on the 2d.

A thunderstorm occurred at Cape May City on the 8th. Dense fog was noted on the 1st, 3d, 4th, 5th, 6th, 7th, 11th, 16th, and 17th. Solar halos were observed on the 4th, 14th, 16th, 18th, and 19th, and lunar halos on the 4th, 10th, 13th, and 14th. The first killing frost occurred at a few stations in Morris and Sussex Counties on the 2d and 9th, at scattered stations in central and northern districts, on the 13th and 14th, and generally throughout the State on the 21st and 23d, except along the southern coast where light to heavy frosts only occurred.

### COMPARATIVE DATA FOR OCTOBER

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

## Daily Precipitation for October, 1924

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXIX.

NOVEMBER, 1924.

No. 11

### GENERAL SUMMARY.

The drought of October continued practically without a break until November 22d, when rains exceeding an inch fell in nearly all portions of the State. There were showers on the 14th-15th, but these were insufficient to mitigate the damaging effects of the drought. Some stations experienced rain of but 0.2 inch in 51 days. This is by far the longest and driest period on record in this region. Except for the storm of the 22d, rain was light and the month closed with a substantial deficiency in moisture. Precipitation was deficient also in frequency of occurrence, which, with a small excess of sunshine, gave a month very favorable to out door work.

A cold period from the 17th to 20th developed some of the coldest weather ever known in this region so early in the month, and shallow ponds were sufficiently frozen for skating. On the 18th temperatures were less than 10° above zero at many places in the State, and the lowest recorded, 1°, becomes the extreme low record for the month. The cold coming so suddenly and early caused a great amount of damage in the aggregate by freezing unprotected root crops, water pipes, etc. Warm periods were mingled with the cold, and altogether the month's weather was mostly pleasant.

Storm warnings were displayed along the coast from the 21st to 23d, on the 27th and 30th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 39 stations, was 42.9°, which was 0.2° below the normal. The highest temperature was 77° at Little Falls on the 2d and Tuckerton on the 7th, and the lowest, 1°, at Runyon on the 18th. The greatest daily range of temperature was 47° at Belleplain on the 20th. The highest monthly mean temperature was 47.0° at Cape May City, and the lowest, 39.6° at Charlotteburg and Sussex.

The temperature departure from the normal for the year 1924, to date, by sections, is: The Highlands, -1.1°; Red Sandstone Plain, -1.2°; Southern Interior, -1.1°; Sea Coast, -0.6°.

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 45 stations, was 2.03 inches, which was 1.07 inches below the normal. The average total snowfall at 22 selected stations was 1.3 inches, which was normal. The greatest monthly precipitation was 3.23 inches, at Tuckerton, and the least, 1.17 inches at South Orange. The greatest amount of precipitation in any 24 consecutive hours was 2.22 inches at Jersey City on the 22d. The mean of the number of days on which 0.01 inch or more of precipitation fell was 5, or 3 less than the normal.

The precipitation accumulated departure from the normal for the year 1924, to date, by sections, is: The Highlands, -4.80 inches; Red Sandstone Plain, +0.26 inch; Southern Interior, +2.72 inches; Sea Coast, -5.40 inches.

### WIND.

The prevailing wind direction was from the northwest. The wind movement averaged 14 miles per hour, which was normal. The highest velocity, sustained for 5 consecutive minutes, was 62 miles per hour from the south at Atlantic City on the 22d.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 14, which was 2 more than the normal; partly cloudy, 8, or 1 less than the normal; cloudy, 8, or 1 less than the normal. The per cent of possible sunshine was 62, which was 4 per cent above the normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.10 inches, or normal. The highest reading was 30.51 inches at Cape May City on the 26th, and the lowest, 29.12 inches at Trenton on the 22d.

The mean stage of the Delaware River at Phillipsburg was 1.0 foot, and the highest stage, 4.0 feet on the 25th. At Trenton the mean daily stage was 0.5 foot, which was 1.3 feet below the normal. The highest stage was 2.7 feet on the 25th.

The first killing frost of the season occurred at scattered points along the coast on the 16th and 17th. Dense fog was observed on the 1st, 6th, 7th, 11th, 12th, and 22d. Thunderstorms occurred in the eastern half of the State on the 22d, and along the coast on the 29th. A solar halo was observed on the 21st, while lunar halos were noted on the 5th, 6th, 7th, 8th, and 18th. Light sleet occurred in portions of Essex County on the 9th, and in portions of Atlantic and Ocean Counties on the 15th.

### COMPARATIVE DATA FOR NOVEMBER

| Year      | Temperature |         |        | Precipitation |          |       | No of days |               |        |                        |

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, a, b, c, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

Daily Precipitation for November, 1924

# CLIMATOLOGICAL DATA.

## NEW JERSEY SECTION.

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXIX.

DECEMBER, 1924.

No. 12

### GENERAL SUMMARY.

The month opened generally fair and cold, but was followed by a warm period from the 5th to the 9th. Another warm period prevailed from the 16th to the 19th. On the 8th and 9th temperatures in the 60's occurred very generally throughout the State, but conditions more typical of winter prevailed thereafter. Two cold waves occurred, one on the 20th and the other on the night of the 25th-26th, the latter following the first appreciable snowfall of the winter. No severe extremes of cold occurred at either time. With the first cold wave, the Delaware River became frozen and continued closed for the remainder of the month. The average monthly temperature for the State was approximately normal, but was in marked contrast with December a year ago, when it was 8° warmer.

Precipitation was deficient and thereby failed to restore the lack of ground water resulting from drought in the early autumn, and water resources were therefore not plentiful at the close of the month. Rainfall was fairly evenly distributed throughout the State and through the month; only traces of snow fell in the southern half of the State, and in the northern half the amount of snow was unimportant. This deficiency of precipitation showed a corresponding stage of low water in streams and ponds.

Storm warnings were displayed along the coast on the 5th, 6th, 8th, 12th, 13th, 19th, 20th, 27th, 28th, and 31st.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 38 stations, was 32.8°, which was 0.2° below the normal. The highest temperature was 68° at Burlington on the 9th. The lowest temperature was 4° below zero at Charlotteburg on the 29th. The greatest daily range of temperature was 39° at Belleplain on the 29th. The highest monthly mean was 36.9° at Atlantic City, and the lowest, 28.4° at Layton.

The temperature departure from the normal for the year 1924, by sections, is: The Highlands, -1.1°; Red Sandstone Plain, -1.2°; Southern Interior, -0.9°; Sea Coast, -0.6°.

### PRECIPITATION.

The mean total precipitation for the State, as deduced from observations of 44 stations, was 2.58 inches, which was 1.38 inches below the normal. The greatest monthly precipitation was 3.42 inches at Cape May City, and the least 1.85 inches at Layton. The average total snowfall of 20 selected stations was 4.3 inches, which was 2.2 inches below the normal; this average ranged from 1.0 inch in the Highlands to 0.1 inch over the Southern Interior, and the Sea Coast. The greatest precipitation accumulated in any 24 consecutive hours was 1.97 inches at Cape May City on the 24th. The average number of days on which 0.01 inch or more of precipitation fell was 8, or 1 less than the normal.

The precipitation accumulated departure from the normal for the year 1924, by sections, is: The Highlands, -6.39 inches;

Red Sandstone Plain, -1.12 inches; Southern Interior, +1.50 inches; Sea Coast, -6.85 inches.

### WIND.

The prevailing wind direction was from the northwest, which was normal. The wind movement averaged 13 miles per hour, which was 1 mile below the normal. The highest velocity, sustained for 5 consecutive minutes, was 54 miles per hour from the west at Sandy Hook on the 14th. High winds were noted also on the 5th, 8th, 13th, 19th, 20th, and 31st.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 10, which was 2 less than normal; partly cloudy, 8, or 1 less than normal; cloudy, 13, which was 3 more than the normal. The per cent of possible sunshine was 44, which was 8 less than normal.

### MISCELLANEOUS.

The mean atmospheric pressure, reduced to sea level, was 30.19 inches, which was 0.09 inch above normal. The highest reading was 30.70 inches at Cape May City on the 26th, and the lowest, 29.25 inches at Sandy Hook on the 13th.

The mean stage of the Delaware River at Phillipsburg was 2.8 feet, and the highest stage, 3.8 feet on the 19th and 20th. At Trenton the mean daily stage was 1.4 feet, which was 1.2 feet below the normal. The highest stage was 2.2 feet on the 11th.

Dense fog occurred on the 8th, 17th and 19th. Sleet was observed at several stations throughout the State on the 5th, 24th, 25th, 30th, and 31st.

### COMPARATIVE DATA FOR DECEMBER

| Year      | Temperature |         |        | Precipitation |          |       | No of days |               |        |                        |

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†† Received too late to be included in the means.

Reference letters, \*, b, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

# CLIMATOLOGICAL DATA.

NEW JERSEY SECTION,  
G. HAROLD NOYES, Meteorologist.  
TRENTON, N. J.

VOL. XXIX. ANNUAL SUMMARY, 1924. No. 13.

## GENERAL SUMMARY.

There were two outstanding features in a general analysis of weather conditions in the year 1924 in New Jersey. The first was the persistent deficiency in warmth, and the other was the steady lack of needed rainfall during the latter half of the year. The temperatures were above normal in January, just normal in March and August, and subnormal in all other months. The early half of the year was productive of an excess of precipitation, except in March, and the later half was dry, except for a small excess in September. The rain in October was so deficient as to constitute the driest month on record for the 40 years of tabulated observations, and some stations during the October-November drought reported over 50 days with but one light shower.

A late snowstorm on April first covered the ground with from two to ten inches of snow, and this caused a decided setback in the forward march of spring, which did not recover, and agriculture advanced to maturity approximately two weeks late.

An early cold wave on the 17th-19th of November abruptly terminated the usual mild and pleasant autumn, temperatures being under 20° in all regions except the immediate coast, and an extreme low reading of 1° breaking the record of the month. Small ponds were frozen, and there was considerable skating.

The past 40 year record of the state, divided into as nearly equal thirds as possible shows a temperature variation of slightly over one tenth of one degree, which is more justifiably accounted for as due to variation in instruments and exposure than to climate change. The precipitation shows greater variation; but for this factor, the period is too brief to exemplify as a fact, whether or not there may be any permanent change in moisture.

The mean temperature for the year, 50.7°, was 1.0° below normal. The warmest was August, 71.9°, and the coldest, February, 28.9°. The highest temperature was 102° at Indian Mills on August 6th, and the lowest, 6° below zero, at Culvers Lake on January 27th. The highest mean temperature was 53.5° at Bridgeton, and the lowest, 46.9° at Charlotteburg. The greatest annual range of temperature was 105° at Layton.

The average precipitation for the State for the year was 44.17 inches, which was 1.71 inches below normal. The greatest monthly average was 6.15 inches in April, and the least, 0.31 inch in October. The greatest monthly amount of precipitation was 9.48 inches at Runyon in August, and the least, trace at Bridgeton in October. The greatest annual precipitation was 54.69 inches at Chatham, and the least, 35.99 inches at Sussex.

The average snowfall for the State was 25.0 inches, which was 5.2 inches below normal. The greatest annual snowfall was 48.2 inches at Culvers Lake, and the least, 5.6 inches at Cape May City.

The average number of days on which 0.01 inch or more precipitation occurred was 102, which was 12 less than normal. The average number of clear days was 177, which was 35 more than normal; partly cloudy, 96, which was 20 less than normal; cloudy, 93, which was 15 less than normal.

The prevailing wind direction was from the northwest; the highest velocity was 88 miles per hour from the northeast at Atlantic City on March 11th.

Light hail with no damage fell at a few stations in March; also on April 20th, June 7th, 14th, 20th and 25th, August 9th,

and 10th. Considerable damage was done by hail on the 17th in the vicinity of Bridgeton and Millville, and little damage occurred at Forked River and Hammonton.

## COMPARATIVE ANNUAL DATA FOR THE STATE

| Year | Temperature |         |        | Average precipitation | Year | Temperature |         |        | Average precipitation |

G. HAROLD NOYES, Meteorologist.

TRENTON, N. J.

VOL. XXX. JANUARY, 1925. No. 1

### GENERAL SUMMARY.

The year opened with cold weather continuing from December, the ground being thoroughly frozen and nearly all bodies of water ice bound. On the 2d a snow storm covered the State with from a few inches to a foot or more of snow which was added to at intervals during the month. The storm of the 20th added a considerable layer of sleet, which with some previous thawing, made a thick ice cover over the ground. In northern districts these conditions were much more severe, while in the southern counties the snow and sleet caused but little trouble. Except in the southern counties, motor highway traffic was very greatly impeded or totally stopped on all roads not cleared. In portions of Hunterdon, Warren and Sussex counties the snowfall was exceptionally heavy, and some of the State highways were only partially cleared and with great difficulty.

Cold waves occurred on the 23d and 27th, and it was the coldest January since 1920 and 1918. The extreme lowest reading,  $-20^{\circ}$ , has been exceeded in only 4 other winters. A warm period occurred from the 4th to the 8th, but thereafter there were not more than two days at a time with warmth above normal. Temperatures were below zero in all portions of the State on the 28th except along the coast and in southern counties.

Ice harvest was successfully carried on, but under considerable difficulty due to snow cover, but its thickness and quality was very good.

Storm warnings were displayed on the coast on the 2d, 7th, 10th, 20th, 22d, 26th, 27th, 29th and 30th.

### TEMPERATURE.

The monthly mean temperature of the State, as deduced from observations of 35 stations, was  $27.4^{\circ}$ , which was  $2.7^{\circ}$  below normal. The highest temperature was  $59^{\circ}$  at Pleasantville on the 26th, and the lowest,  $20^{\circ}$  below zero, at Layton on the 28th. The greatest daily range of temperature was  $47^{\circ}$  at Boonton on the 25th. The highest monthly mean temperature was  $34.7^{\circ}$  at Cape May City, and the lowest  $21.6^{\circ}$  at Layton.

The temperature departure from the normal for the year, 1925, to date, by sections, is: The Highlands,  $-3.6^{\circ}$ ; Red Sandstone Plain,  $-3.9^{\circ}$ ; Southern Interior,  $-1.9^{\circ}$ ; Sea Coast,  $-0.4^{\circ}$ .

### PRECIPITATION.

The mean total precipitation of the State, as deduced from observations of 41 stations, was 4.43 inches, which was 0.81 inch above normal. The average total snowfall at 20 selected stations was 22.8 inches, which was 15.2 inches above normal. The greatest monthly precipitation was 8.73 inches, at Belvidere, and the least, 2.54 inches at Clayton. The greatest amount of precipitation in any 24 consecutive hours was 2.70 inches at South Orange on the 2d and 3d. The mean of the number of days on which 0.01 inch or more of precipitation fell was 10, which was normal.

The precipitation accumulated departure from the normal for the year 1925, to date, by sections, is: The Highlands,  $+0.96$

inch; Red Sandstone Plain,  $+0.85$  inch; Southern Interior,  $+0.75$  inch; Sea Coast,  $+0.53$  inch.

### WIND.

The prevailing wind direction was from the northeast. The wind movement was 16 miles per hour, which was 2 miles above the normal. The highest velocity, sustained for 5 consecutive minutes, was 78 miles per hour from the northeast at Atlantic City on the 2d.

### SUNSHINE AND CLOUDINESS.

The average number of clear days throughout the State was 12, which was 1 more than normal; partly cloudy 6, or 3 less than normal; cloudy, 13, or 2 more than normal. The per cent of possible sunshine was 46, which was 4 per cent below the normal.

### MISCELLANEOUS.

Atmospheric pressure, reduced to sea level, averaged 30.19 inches, which was 0.08 inch above normal. The highest reading was 30.71 inches at Trenton on the 24th, and the lowest, 29.31 inches at Sandy Hook on the 29th.

The Delaware River was frozen throughout the month at Phillipsburg and Trenton.

Dense fog occurred on the 7th, 13th, 16th, 17th, 26th, and 29th. Solar halos were observed on the 7th, 9th, 19th, and 31st, and lunar halos on the 7th, 9th, and 31st. Sleet fell on the 2d, 3d, 10th, 11th, 12th, 16th, 20th, 27th, 29th, and 30th. Thunderstorms were reported on the 20th and 29th.

### COMPARATIVE DATA FOR JANUARY

† On other dates also.

§ Length of precipitation record; temperature record is much shorter.

§ Incomplete.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, \*, †, etc., appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

T, precipitation is less than 0.01 inch rain or melted snow.

†† Post-office address as follows.—Culvers Lake is Branchville; Bergen Point is Bayonne; Highwood is Englewood; Indian Mills is Atsion; New Milford and Woodcliff Lake are Weehawken; Northfield is Pleasantville; Pleasantville and Runyon are Trenton.

Daily Precipitation for January, 1925
